## Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSIONER"

AEC0002

The supplemental Restraint System such as "AIR BAG" and "SEAT BELT PRE-TENSIONER" used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. The SRS system composition which is available to NISSAN MODEL PATHFINDER is as follows:

- For a frontal collision
  - The Supplemental Restraint System consists of driver air bag module (located in the center of the steering wheel), front passenger air bag module (located on the instrument panel on passenger side), seat belt pre-tensioners, a diagnosis sensor unit, warning lamp, wiring harness and spiral cable.
- For a side collision
  - The Supplemental Restraint System consists of side air bag module (located in the outer side of front seat), satellite sensor, diagnosis sensor unit (one of components of air bags for a frontal collision), wiring harness, warning lamp (one of components of air bags for a frontal collision).

Information necessary to service the system safely is included in the RS section of this Service Manual.

#### **WARNING:**

- To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death
  in the event of a collision which would result in air bag inflation, all maintenance must be performed
  by an authorized NISSAN dealer.
- Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see the RS section.
- Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. Spiral cable and wiring harnesses (except "SEAT BELT PRE-TENSIONER") covered with yellow insulation either just before the harness connectors or for the complete harness are related to the SRS.

## Precautions for On Board Diagnostic (OBD) System of Engine and A/T

The ECM has an on board diagnostic system. It will light up the malfunction indicator lamp (MIL) to warn the driver of a malfunction causing emission deterioration.

#### **CAUTION:**

- Be sure to turn the ignition switch "OFF" and disconnect the negative battery terminal before any repair or inspection work. The open/short circuit of related switches, sensors, solenoid valves, etc. will cause the MIL to light up.
- Be sure to connect and lock the connectors securely after work. A loose (unlocked) connector will cause the MIL to light up due to the open circuit. (Be sure the connector is free from water, grease, dirt, bent terminals, etc.)
- Be sure to route and secure the harnesses properly after work. The interference of the harness with a bracket, etc. may cause the MIL to light up due to the short circuit.
- Be sure to connect rubber tubes properly after work. A misconnected or disconnected rubber tube
  may cause the MIL to light up due to the malfunction of the EGR system or fuel injection system,
  etc.
- Be sure to erase the unnecessary malfunction information (repairs completed) from the ECM and TCM (Transmission control module) before returning the vehicle to the customer.

## **Engine Fuel & Emission Control System**

GI

MA

ΈM

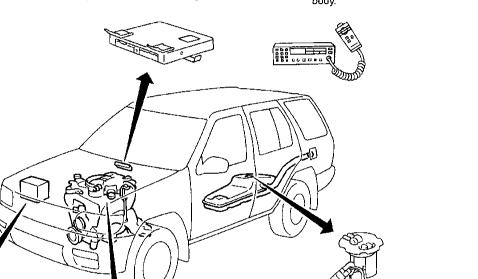

#### **ECM**

- Do not disassemble ECM.
- Do not turn diagnosis test mode selector forcibly.
- · If a battery terminal is disconnected, the memory will return to the ECM value.

The ECM will not start to self-control at its initial value. Engine operation can vary slightly when the terminal is disconnected. However, this is not an indication of a problem. Do not replace parts because of a slight variation.

#### WIRELESS EQUIPMENT

- · When installing CB ham radio or a mobile phone, be sure to observe the following as it may adversely affect electronic control systems depending on its installation location.
- 1) Keep the antenna as far away as possible from the electronic control units.
- 2) Keep the antenna feeder line more than 20 cm (7.9 in) away from the harness of electronic controls. Do not let them run parallel for a long distance.
- 3) Adjust the antenna and feeder line so that the standing-wave ratio can be kept smaller.
- 4) Be sure to ground the radio to vehicle body.

#### **BATTERY**

- · Always use a 12 volt battery as power source.
- · Do not attempt to disconnect battery cables while engine is running.

#### WHEN STARTING

- Do not depress accelerator pedal when starting.
- Immediately after starting, do not rev up. engine unnecessarily.
- Do not rev up engine just prior to shutdown.

#### **ECM PARTS HANDLING**

- · Handle mass air flow sensor carefully to avoid damage.
- Do not disassemble mass air flow sensor.
- · Do not clean mass air flow sensor with any type of detergent.
- Do not disassemble IACV-AAC valve.
- Even a slight leak in the air intake system can cause serious problems.
- · Do not shock or jar the camshaft position sensor or crankshaft position sensor (OBD).

#### **FUEL PUMP**

- Do not operate fuel pump when there is no fuel in lines.
- · Tighten fuel hose clamps to the specified torque. (Refer to MA section.)

#### **ECM HARNESS HANDLING**

- Securely connect ECM harness connectors.
- A poor connection can cause an extremely high (surge) voltage to develop in coil and condenser, thus resulting in damage to ICs.
- Keep ECM harness at least 10 cm (3.9 in.) away from adjacent harnesses to prevent an ECM system malfunction due to receiving external noise, degraded operation of ICs, etc.
- Keep ECM parts and harnesses dry.
- Before removing parts, turn off ignition switch and then disconnect battery ground cable.

### **Precautions**

Before connecting or disconnecting the ECM harness connector, turn ignition switch OFF and disconnect negative battery terminal. Failure to do so may damage the ECM because battery voltage is applied to ECM even if ignition switch is turned off.

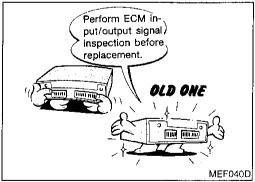

When connecting ECM harness connector, tighten securing bolt until the gap between orange indicators disappears.

(0.3 - 0.5 kg-m, 26 - 43 in-lb)

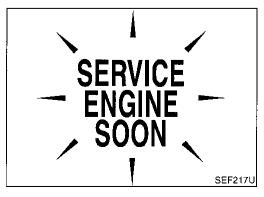

When connecting or disconnecting pin connectors into or from ECM, take care not to damage pin terminals (bend or break).

Make sure that there are not any bends or breaks on ECM pin terminal, when connecting pin connectors.

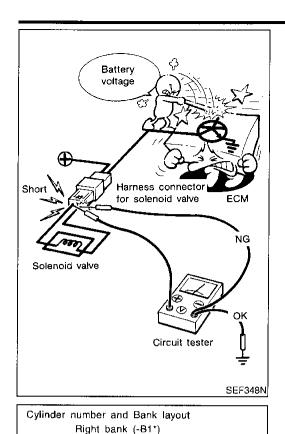

Before replacing ECM, perform "ECM Terminals and Reference Value" inspection and make sure ECM functions properly. Refer to EC-106.

After performing each TROUBLE DIAGNOSIS, perform "DTC Confirmation Procedure" or "Overall Function Check".

The DTC should not be displayed in the "DTC Confirmation Procedure" if the repair is completed. The "Overall Function Check" should be a good result if the repair is completed.

Front

\*: CONSULT indication

When measuring ECM signals with a circuit tester, never allow the two tester probes to contact.

Accidental contact of probes will cause a short circuit and damage the ECM power transistor.

## **Basic Multiport Fuel Injection System**

NAEC001450

The amount of fuel injected from the fuel injector is determined by the ECM. The ECM controls the length of time the valve remains open (injection pulse duration). The amount of fuel injected is a program value in the ECM memory. The program value is preset by engine operating conditions. These conditions are determined by input signals (for engine speed and intake air) from both the camshaft position sensor and the mass air flow sensor.

### Various Fuel Injection Increase/Decrease Compensation

NAEC0014S03

In addition, the amount of fuel injected is compensated to improve engine performance under various operating conditions as listed below.

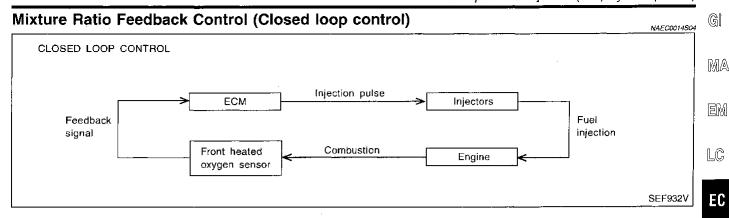

#### <Fuel increase>

- During warm-up
- When starting the engine
- During acceleration
- Hot-engine operation
- When selector lever is changed from "N" to "D"
- High-load, high-speed operation

#### <Fuel decrease>

- During deceleration
- During high engine speed operation

Multiport Fuel Injection (MFI) System (Cont'd)

The mixture ratio feedback system provides the best air-fuel mixture ratio for driveability and emission control. The warm-up three way catalyst can then better reduce CO, HC and NOx emissions. This system uses a front heated oxygen sensor in the exhaust manifold to monitor if the engine operation is rich or lean. The ECM adjusts the injection pulse width according to the sensor voltage signal. For more information about the front heated oxygen sensor, refer to EC-167. This maintains the mixture ratio within the range of stoichiometric (ideal air-fuel mixture).

This stage is referred to as the closed loop control condition.

Rear heated oxygen sensor is located downstream of the warm-up three way catalyst. Even if the switching characteristics of the front heated oxygen sensor shift, the air-fuel ratio is controlled to stoichiometric by the signal from the rear heated oxygen sensor.

### **Open Loop Control**

The open loop system condition refers to when the ECM detects any of the following conditions. Feedback control stops in order to maintain stabilized fuel combustion.

- Deceleration and acceleration
- High-load, high-speed operation
- Malfunction of front heated oxygen sensor or its circuit
- Insufficient activation of front heated oxygen sensor at low engine coolant temperature
- High engine coolant temperature
- During warm-up
- When starting the engine

### Mixture Ratio Self-learning Control

The mixture ratio feedback control system monitors the mixture ratio signal transmitted from the front heated oxygen sensor. This feedback signal is then sent to the ECM. The ECM controls the basic mixture ratio as close to the theoretical mixture ratio as possible. However, the basic mixture ratio is not necessarily controlled as originally designed. Both manufacturing differences (i.e., mass air flow sensor hot wire) and characteristic changes during operation (i.e., injector clogging) directly affect mixture ratio.

Accordingly, the difference between the basic and theoretical mixture ratios is monitored in this system. This is then computed in terms of "injection pulse duration" to automatically compensate for the difference between the two ratios.

"Fuel trim" refers to the feedback compensation value compared against the basic injection duration. Fuel trim includes short term fuel trim and long term fuel trim.

"Short term fuel trim" is the short-term fuel compensation used to maintain the mixture ratio at its theoretical value. The signal from the front heated oxygen sensor indicates whether the mixture ratio is RICH or LEAN compared to the theoretical value. The signal then triggers a reduction in fuel volume if the mixture ratio is rich, and an increase in fuel volume if it is lean.

"Long term fuel trim" is overall fuel compensation carried out long-term to compensate for continual deviation of the short term fuel trim from the central value. Such deviation will occur due to individual engine differences, wear over time and changes in the usage environment.

Multiport Fuel Injection (MFI) System (Cont'd)

#### **Fuel Injection Timing** NAEC0014807 · Sequential multiport fuel injection system · Simultaneous multiport fuel injection system No. 1 cylinder No. 2 cylinder No. 2 cylinder No. 3 cylinder No. 3 cylinder No. 4 cylinder No. 4 cylinder No. 5 cylinder No. 5 cylinder No. 6 cylinder No. 6 cylinder engine cycle engine cycle SEF179U

Two types of systems are used.

### Sequential Multiport Fuel Injection System

NAEC001480701

Fuel is injected into each cylinder during each engine cycle according to the firing order. This system is used when the engine is running.

### Simultaneous Multiport Fuel Injection System

NAEC0014S0702

Fuel is injected simultaneously into all six cylinders twice each engine cycle. In other words, pulse signals of the same width are simultaneously transmitted from the ECM.

The six injectors will then receive the signals two times for each engine cycle.

This system is used when the engine is being started and/or if the fail-safe system (CPU) is operating.

#### **Fuel Shut-off**

NAEC0014S08

Fuel to each cylinder is cut off during deceleration or operation of the engine at excessively high speeds.

### **Distributor Ignition (DI) System**

ΪF

PD

ΔX

The ignition timing is controlled by the ECM to maintain the best air-fuel ratio for every running condition of the engine. The ignition timing data is stored in the ECM. This data forms the map shown.

The ECM receives information such as the injection pulse width and camshaft position sensor signal. Computing this information, ignition signals are transmitted to the power transistor.

N: 1,800 rpm, Tp: 1.50 msec e.g.,

A °BTDC

During the following conditions, the ignition timing is revised by the ECM according to the other data stored in the ECM.

- At starting
- During warm-up
- At idle
- At low battery voltage
- During acceleration

The knock sensor retard system is designed only for emergencies. The basic ignition timing is programmed within the anti-knocking zone, if recommended fuel is used under dry conditions. The retard system does not operate under normal driving conditions. If engine knocking occurs, the knock sensor monitors the condition. The signal is transmitted to the ECM. The ECM retards the ignition timing to eliminate the knocking condition.

## System Description

NAEC0016502

This system improves engine operation when the air conditioner is used. Under the following conditions, the air conditioner is turned off.

- When the accelerator pedal is fully depressed.
- When cranking the engine.
- At high engine speeds.
- When the engine coolant temperature becomes excessively high.
- When operating power steering during low engine speed or low vehicle speed.
- When engine speed is excessively low.

Fuel Cut Control (at no load & high engine speed)

## Fuel Cut Control (at no load & high engine speed)

## DESCRIPTION Input/Output Signal Line

NAEC0017 NAEC0017501

Actuator	

Sensor	Input Signal to ECM	ECM func- tion	Actuator
Vehicle speed sensor	Vehicle speed		
Park/Neutral position (PNP) switch	Neutral position		
Throttle position sensor	Throttle position	Fuel cut control	Injectors
Engine coolant temperature sensor	Engine coolant temperature		
Camshaft position sensor	Engine speed		

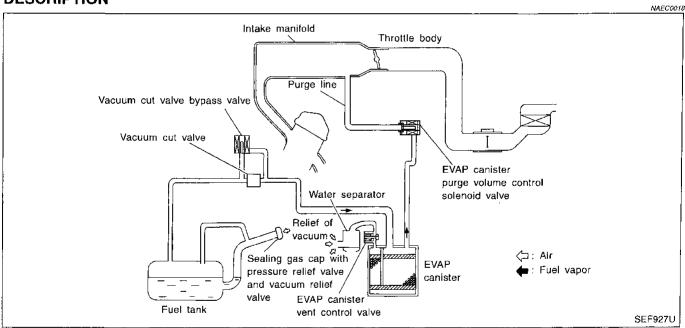

If the engine speed is above 2,500 rpm with no load (for example, in neutral and engine speed over 2,500 rpm) fuel will be cut off after some time. The exact time when the fuel is cut off varies based on engine speed. Fuel cut will operate until the engine speed reaches 2,000 rpm, then fuel cut is cancelled.

#### NOTE:

This function is different from deceleration control listed under "Multiport Fuel Injection (MFI) System", EC-20.

## **Evaporative Emission System**

#### DESCRIPTION

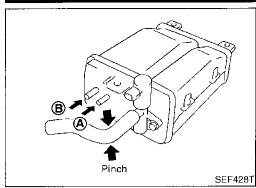

The evaporative emission system is used to reduce hydrocarbons emitted into the atmosphere from the fuel system. This reduction of hydrocarbons is accomplished by activated charcoals in the EVAP canister.

The fuel vapor in the sealed fuel tank is led into the EVAP canister which contains activated carbon and the vapor is stored there when the engine is not operating or when refueling to the fuel tank.

The vapor in the EVAP canister is purged by the air through the purge line to the intake manifold when the engine is operating. EVAP canister purge volume control solenoid valve is controlled by ECM. When the engine operates, the flow rate of vapor controlled by EVAP canister purge volume control solenoid valve is proportionally regulated as the air flow increases.

EVAP canister purge volume control solenoid valve also shuts off the vapor purge line during decelerating and idling.

Evaporative Emission System (Cont'd)

# INSPECTION **EVAP Canister**

NAEC0019

Check EVAP canister as follows:

NAEC0019S01

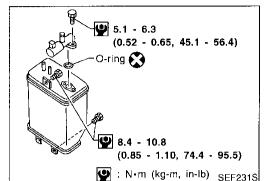

- Pinch the fresh air hose.
- Blow air into port **A** and check that it flows freely out of port **B**.

#### **Evap Service Port**

Positive pressure is delivered to the EVAP system through the EVAP service port. If fuel vapor leakage in the EVAP system occurs, use a leak detector to locate the leak.

■ EVAP SYSTEM CLOSE ■
APPLY PRESSURE TO EVAP
SYSTEM FROM SERVICE
PORT USING HAND PUMP
WITH PRESSURE GAUGE AT
NEXT SCREEN.
NEVER USE COMPRESSED
AIR OR HIGH PRESSURE
PUMP!
DO NOT START ENGINE.
TOUCH START.

SEF838U

## How to Detect Fuel Vapor Leakage CAUTION:

NAEC0019510

- Never use compressed air or a high pressure pump.
- Do not exceed 4.12 kPa (0.042 kg/cm<sup>2</sup>, 0.6 psi) of pressure in EVAP system.

#### NOTE:

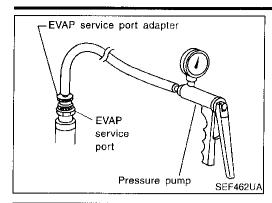

- Do not start engine.
- Improper installation of EVAP service port adapter to the EVAP service port may cause a leak.

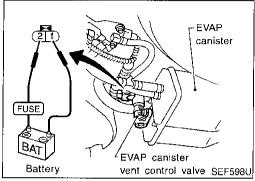

#### (P) With CONSULT

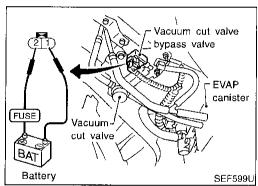

- 1) Attach the EVAP service port adapter securely to the EVAP service port.
- Also attach the pressure pump and hose to the EVAP service port adapter.
- 3) Turn ignition switch "ON".
- 4) Select the "EVAP SYSTEM CLOSE" of "WORK SUPPORT MODE" with CONSULT.
- 5) Touch "START". A bar graph (Pressure indicating display) will appear on the screen.
- 6) Apply positive pressure to the EVAP system until the pressure indicator reaches the middle of the bar graph.
- 7) Remove EVAP service port adapter and hose with pressure pump.
- 8) Locate the leak using a leak detector. Refer to "EVAPORATIVE EMISSION LINE DRAWING", EC-28.

**EC-26** 

Evaporative Emission System (Cont'd)

### **W** Without CONSULT

 Apply battery voltage to between the terminals of both EVAP canister vent control valve and vacuum cut valve bypass valve to make a closed EVAP system.

4) To locate the leak, deliver positive pressure to the EVAP system until pressure gauge points reach 1.38 - 2.76 kPa (0.014 - 0.028 kg/cm², 0.2 - 0.4 psi).

 Remove EVAP service port adapter and hose with pressure pump.

 Locate the leak using a leak detector. Refer to "EVAPORATIVE EMISSION LINE DRAWING", EC-28.

#### NOTE:

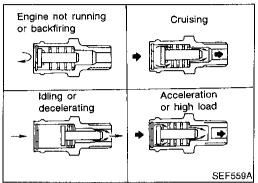

Do not use soapy water or any type of solvent while installing vacuum hose or purge hoses.

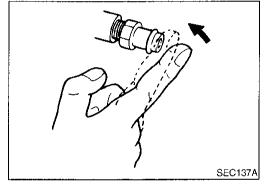

Evaporative Emission System (Cont'd)

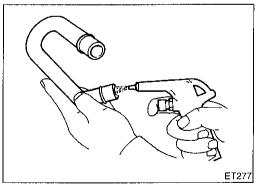

Positive Crankcase Ventilation

## Positive Crankcase Ventilation DESCRIPTION

This system returns blow-by gas to the intake manifold.

The positive crankcase ventilation (PCV) valve is provided to conduct crankcase blow-by gas to the intake manifold.

During partial throttle operation of the engine, the intake manifold sucks the blow-by gas through the PCV valve.

Normally, the capacity of the valve is sufficient to handle any blow-by and a small amount of ventilating air.

The ventilating air is then drawn from the air inlet tubes into the crankcase. In this process the air passes through the hose connecting air inlet tubes to rocker cover.

Under full-throttle condition, the manifold vacuum is insufficient to draw the blow-by flow through the valve. The flow goes through the hose connection in the reverse direction.

On vehicles with an excessively high blow-by, the valve does not meet the requirement. This is because some of the flow will go through the hose connection to the air inlet tubes under all conditions.

#### INSPECTION

### PCV (Positive Crankcase Ventilation) Valve

NAEC002

NAFC0021

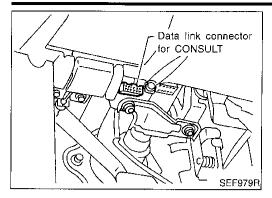

With engine running at idle, remove PCV valve ventilation hose from PCV valve; if the valve is working properly, a hissing noise will be heard as air passes through it and a strong vacuum should be felt immediately when a finger is placed over valve inlet.

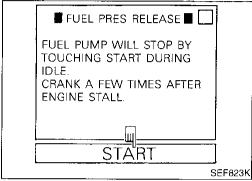

#### **PCV Valve Ventilation Hose**

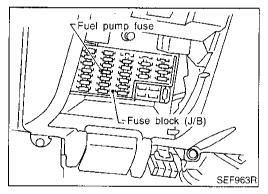

NAEC0022S02

- Check hoses and hose connections for leaks.
- Disconnect all hoses and clean with compressed air. If any hose cannot be freed of obstructions, replace.

Fuel Pressure Release

#### **Fuel Pressure Release**

MECAAAA

**G**[

MM

EM

Before disconnecting fuel line, release fuel pressure from fuel line to eliminate danger.

#### **® WITH CONSULT**

NAEC0023S01

- 1. Turn ignition switch "ON".
- Perform "FUEL PRESSURE RELEASE" in "WORK SUP-PORT" mode with CONSULT.

Start engine.

LC LC

- 4. After engine stalls, crank it two or three times to release all fuel pressure.
- 5. Turn ignition switch "OFF".

EC

FE

CL

MT

AT

M WITHOUT CONSULT

NAEC0023S02

- 1. Remove fuel pump fuse located in fuse box.
- Start engine.

TF

- 3. After engine stalls, crank it two or three times to release all fuel pressure.
- 4. Turn ignition switch "OFF".
- 5. Reinstall fuel pump fuse after servicing fuel system.

#### Fuel Pressure Check

NAEC0024

- When reconnecting fuel line, always use new clamps.
- Make sure that clamp screw does not contact adjacent parts.
- Use a torque driver to tighten clamps.

ST

- Use Pressure Gauge to check fuel pressure.
- Do not perform fuel pressure check with system operating. Fuel pressure gauge may indicate false readings.

' |R\$

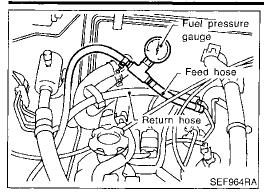

- 1. Release fuel pressure to zero.
- Disconnect fuel hose between fuel filter and fuel tube (engine side).

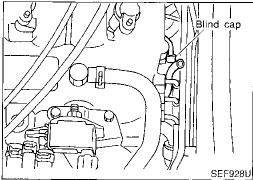

HA

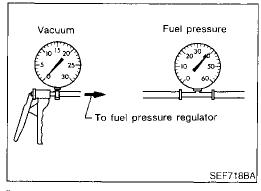

37

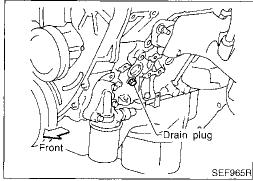

SC

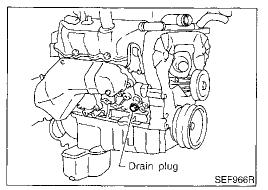

EL

- 3. Install pressure gauge between fuel filter and fuel tube.
- 4. Start engine and check for fuel leakage.
- 5. Read the indication of fuel pressure gauge.

#### At idling:

With vacuum hose connected
Approximately 235 kPa (2.4 kg/cm², 34 psi)
With vacuum hose disconnected
Approximately 294 kPa (3.0 kg/cm², 43 psi)

If results are unsatisfactory, perform Fuel Pressure Regulator Check.

## **Fuel Pressure Regulator Check**

IAFC0387

- 1. Stop engine and disconnect fuel pressure regulator vacuum hose from intake manifold.
- 2. Plug intake manifold with a blind cap.
- 3. Connect variable vacuum source to fuel pressure regulator.

 Start engine and read indication of fuel pressure gauge as vacuum is changed.

Fuel pressure should decrease as vacuum increases. If results are unsatisfactory, replace fuel pressure regulator.

## Injector

#### **REMOVAL AND INSTALLATION**

NAECO025

- 1. Release fuel pressure to zero. Refer to EC-31.
- Drain coolant by removing drain plugs from both sides of cylinder block.
- 3. Separate ASCD and accelerator control wire from intake manifold collector.
- 4. Remove intake manifold collector from engine.

  The following parts should be disconnected or removed.
- a. Harness connectors for
- IACV-AAC valve
- IACV-FICD solenoid valve
- Throttle position sensor and closed throttle position switch assembly
- EGRC-solenoid valve
- EGR temperature sensor
- Ground harness
- b. PCV valve ventilation hoses
- c. Vacuum hoses for
- Brake booster
- EGRC-solenoid valve

#### Introduction

IAEC002I

The ECM has an on board diagnostic system, which detects malfunctions related to engine sensors or actuators. The ECM also records various emission-related diagnostic information including:

Emission-related diagnostic information	SAE Mode
Diagnostic Trouble Code (DTC)	Mode 3 of SAE J1979
Freeze Frame data	Mode 2 of SAE J1979
System Readiness Test (SRT) code	Mode 1 of SAE J1979
1st Trip Diagnostic Trouble Code (1st Trip DTC)	Mode 7 of SAE J1979
1st Trip Freeze Frame data	
Test values and Test limits	Mode 6 of SAE J1979

The above information can be checked using procedures listed in the table below.

X: Applicable —: Not applicable

	DTC	1st trip DTC	Freeze Frame data	1st trip Freeze Frame data	SRT code	Test value
Diagnostic test mode II (Self-diagnostic results)	Х	X*1	_			
CONSULT	Х	×	X	Х	X	
GST	Х	X*2	X	_	X	Х

<sup>\*1:</sup> When DTC and 1st trip DTC simultaneously appear on the display, they cannot be clearly distinguished from each other.

The malfunction indicator lamp (MIL) on the instrument panel lights up when the same malfunction is detected in two consecutive trips (Two trip detection logic), or when the ECM enters fail-safe mode. (Refer to EC-96.)

## **Two Trip Detection Logic**

NAEC002

When a malfunction is detected for the first time, 1st trip DTC and 1st trip Freeze Frame data are stored in the ECM memory. The MIL will not light up at this stage. <1st trip>

If the same malfunction is detected again during the next drive, the DTC and Freeze Frame data are stored in the ECM memory, and the MIL lights up. The MIL lights up at the same time when the DTC is stored. <2nd trip> The "trip" in the "Two Trip Detection Logic" means a driving mode in which self-diagnosis is performed during vehicle operation. Specific on board diagnostic items will cause the ECM to light up or blink the MIL, and store DTC and Freeze Frame data, even in the 1st trip, as shown below.

X: Applicable --: Not applicable

	MIL			DTC		1st trip DTC		
Items	1st trip		2nd trip	1st trip dis-	2nd trip	1st trip dis-	2nd trip	
•	Blinking Lighting up		lighting up	playing	displaying	playing	displaying	
Misfire (Possible three way catalyst damage) — DTC: P0300 - P0306 (0701, 0603 - 0608) is being detected	x		_	x		×		
Misfire (Possible three way catalyst damage) — DTC: P0300 - P0306 (0701, 0603 - 0608) has been detected	_	х	_	х	-	×	_	
Closed loop control — DTC: P1148 (0307), P1168 (0308)		×	_	х		Х		
Fail-safe items (Refer to EC-96.)		Х	_	X*1		X*1		
Except above	_		Х	-	Х	Х	Х	

<sup>\*1:</sup> Except "ECM"

<sup>\*2: 1</sup>st trip DTCs for self-diagnoses concerning SRT items cannot be shown on the GST display.

Emission-related Diagnostic Information

## **Emission-related Diagnostic Information**

#### **DTC AND 1ST TRIP DTC**

The 1st trip DTC (whose number is the same as the DTC number) is displayed for the latest self-diagnostic result obtained. If the ECM memory was cleared previously, and the 1st trip DTC did not reoccur, the 1st trip DTC will not be displayed.

If a malfunction is detected during the 1st trip, the 1st trip DTC is stored in the ECM memory. The MIL will not light up (two trip detection logic). If the same malfunction is not detected in the 2nd trip (meeting the required driving pattern), the 1st trip DTC is cleared from the ECM memory. If the same malfunction is detected in the 2nd trip, both the 1st trip DTC and DTC are stored in the ECM memory and the MIL lights up. In other words, the DTC is stored in the ECM memory and the MIL lights up when the same malfunction occurs in two consecutive trips. If a 1st trip DTC is stored and a non-diagnostic operation is performed between the 1st and 2nd trips, only the 1st trip DTC will continue to be stored. For malfunctions that blink or light up the MIL during the 1st trip, the DTC and 1st trip DTC are stored in the ECM memory.

Procedures for clearing the DTC and the 1st trip DTC from the ECM memory are described in "HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION". Refer to EC-55.

For malfunctions in which 1st trip DTCs are displayed, refer to EC-53. These items are required by legal regulations to continuously monitor the system/component. In addition, the items monitored non-continuously are also displayed on CONSULT.

1st trip DTC is specified in Mode 7 of SAE J1979. 1st trip DTC detection occurs without lighting up the MIL and therefore does not warn the driver of a problem. However, 1st trip DTC detection will not prevent the vehicle from being tested, for example during Inspection/Maintenance (I/M) tests.

When a 1st trip DTC is detected, check, print out or write down and erase (1st trip) DTC and Freeze Frame data as specified in "Work Flow" procedure Step II, refer to EC-84. Then perform "DTC Confirmation Procedure" or "Overall Function Check" to try to duplicate the problem. If the malfunction is duplicated, the item AT requires repair.

#### How to Read DTC and 1st Trip DTC

DTC and 1st trip DTC can be read by the following methods.

1) 🙈 No Tools

The number of blinks of the MIL in the Diagnostic Test Mode II (Self-Diagnostic Results) Examples: 0101, 🔣 0201, 1003, 1104, etc.

These DTCs are controlled by NISSAN.

(A) With CONSULT

With GST

CONSULT or GST (Generic Scan Tool) Examples: P0340, P1320, P0705, P0750, etc. These DTCs are prescribed by SAE J2012.

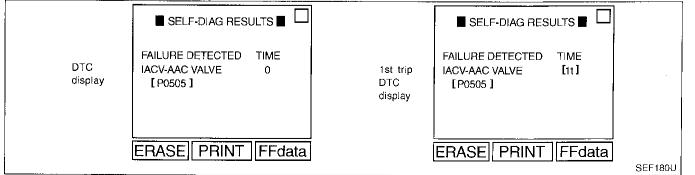

(CONSULT also displays the malfunctioning component or system.)

- 1st trip DTC No. is the same as DTC No.
- Output of a DTC indicates a malfunction. However, Mode II and GST do not indicate whether the malfunction is still occurring or has occurred in the past and has returned to normal.CONSULT can identify malfunction status as shown below. Therefore, using CONSULT (if available) is recommended.

A sample of CONSULT display for DTC and 1st trip DTC is shown below. DTC or 1st trip DTC of a malfunction is displayed in SELF-DIAGNOSTIC RESULTS mode of CONSULT. Time data indicates how many times the vehicle was driven after the last detection of a DTC.

If the DTC is being detected currently, the time data will be "0".

If a 1st trip DTC is stored in the ECM, the time data will be "[1t]".

Emission-related Diagnostic Information (Cont'd)

#### FREEZE FRAME DATA AND 1ST TRIP FREEZE FRAME DATA

NAECOO3OSO2

The ECM records the driving conditions such as fuel system status, calculated load value, engine coolant temperature, short term fuel trim, long term fuel trim, engine speed, vehicle speed and absolute pressure at the moment a malfunction is detected.

Data which are stored in the ECM memory, along with the 1st trip DTC, are called 1st trip freeze frame data. The data, stored together with the DTC data, are called freeze frame data and displayed on CONSULT or GST. The 1st trip freeze frame data can only be displayed on the CONSULT screen, not on the GST. For details, see EC-71.

Only one set of freeze frame data (either 1st trip freeze frame data or freeze frame data) can be stored in the ECM. 1st trip freeze frame data is stored in the ECM memory along with the 1st trip DTC. There is no priority for 1st trip freeze frame data and it is updated each time a different 1st trip DTC is detected. However, once freeze frame data (2nd trip detection/MIL on) is stored in the ECM memory, 1st trip freeze frame data is no longer stored. Remember, only one set of freeze frame data can be stored in the ECM. The ECM has the following priorities to update the data.

Priority		Items
1	Freeze frame data	Misfire — DTC: P0300 - P0306 (0701, 0603 - 0608) Fuel Injection System Function — DTC: P0171 (0115), P0172 (0114), P0174 (0210), P0175 (0209)
2		Except the above items (Includes A/T related items)
3	1st trip freeze frame	data

For example, the EGR malfunction (Priority: 2) was detected and the freeze frame data was stored in the 2nd trip. After that when the misfire (Priority: 1) is detected in another trip, the freeze frame data will be updated from the EGR malfunction to the misfire. The 1st trip freeze frame data is updated each time a different malfunction is detected. There is no priority for 1st trip freeze frame data. However, once freeze frame data is stored in the ECM memory, 1st trip freeze data is no longer stored (because only one freeze frame data or 1st trip freeze frame data can be stored in the ECM). If freeze frame data is stored in the ECM memory and freeze frame data with the same priority occurs later, the first (original) freeze frame data remains unchanged in the ECM memory.

Both 1st trip freeze frame data and freeze frame data (along with the DTCs) are cleared when the ECM memory is erased. Procedures for clearing the ECM memory are described in "HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION". Refer to EC-55.

#### SYSTEM READINESS TEST (SRT) CODE

NAEC0030S

System Readiness Test (SRT) code is specified in Mode 1 of SAE J1979. It indicates whether the self-diagnostic tests for non-continuously monitored items have been completed or not.

inspection/Maintenance (I/M) tests of the on board diagnostic (OBD) II system may become the legal requirements in some states/areas. All SRT codes must be set in this case. Unless all SRT codes are set, conducting the I/M test may not be allowed.

SRT codes are set after self-diagnosis has been performed one or more times. This occurs regardless of whether the diagnosis is in "OK" or "NG", and whether or not the diagnosis is performed in consecutive trips. The following table lists the 5 SRT items (30 test items) for the ECM used in R50 models.

SRT items	Self-diagnostic test items
Catalyst monitoring	<ul> <li>Three way catalyst function (right bank) P0420 (0702)</li> <li>Three way catalyst function (left bank) P0430 (0703)</li> </ul>
EVAP system monitoring	<ul> <li>EVAP control system (Small leak — negative pressure) P0440 (0705)</li> <li>EVAP control system (Small leak — positive pressure) P1440 (0213)</li> <li>EVAP control system purge flow monitoring P1447 (0111)</li> </ul>

remain disconnected for more than 24 hours, all SRT codes may be cleared from the ECM memory.

## NAEC0030S0301

# How to Display SRT Code

1. 

With CONSULT

Selecting "SRT STATUS" in "DTC CONFIRMATION" mode with CONSULT. For items whose SRT codes are set, a "CMPLT" is displayed on the CONSULT screen; for items whose SRT codes are not set, "INCMP" is displayed.

2. @ With GST

Selecting Mode 1 with GST (Generic Scan Tool)

A sample of CONSULT display for SRT code is shown below.

"INCMP" means the self-diagnosis is incomplete and SRT is not set. "CMPLT" means the self-diagnosis is \$\sqrt{1}\$ complete and SRT is set.

Emission-related Diagnostic Information (Cont'd)

#### How to Set SRT Code

To set all SRT codes, self-diagnosis for the items indicated above must be performed one or more times. Each diagnosis may require a long period of actual driving under various conditions. The most efficient driving pattern in which SRT codes can be properly set is explained on the next page. The driving pattern should be performed one or more times to set all SRT codes.

Emission-related Diagnostic Information (Cont'd)

Emission-related Diagnostic Information (Cont'd)

- The time required for each diagnosis varies with road surface conditions, weather, altitude, individual driving habits, etc.
  - Zone A refers to the range where the time required, for the diagnosis under normal conditions\*, is the shortest.
  - Zone B refers to the range where the diagnosis can still be performed if the diagnosis is not completed within zone A.
- \*: Normal conditions refer to the following:
- Sea level
- Flat road
- Ambient air temperature: 20 30°C (68 86°F)
- Diagnosis is performed as quickly as possible under normal conditions.
   Under different conditions [For example: ambient air temperature other than 20 30°C (68 86°F)], diagnosis may also be performed.

#### Pattern 1:

- The engine is started at the engine coolant temperature of −10 to 35°C (14 to 95°F) (where the voltage between the ECM terminals 59 and 43 is 3.0 - 4.3V).
- The engine must be operated at idle speed until the engine coolant temperature is greater than 70°C (158°F) (where the voltage between the ECM terminals 59 and 43 is lower than 1.4V).
- The engine is started at the tank fuel temperature of warmer than 0°C (32°F) (where the voltage between the ECM terminal 60 and ground is less than 4.1V).

#### Pattern 2:

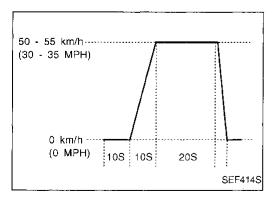

• When steady-state driving is performed again even after it is interrupted, each diagnosis can be conducted. In this case, the time required for diagnosis may be extended.

#### Pattern 3:

The driving pattern outlined in \*2 must be repeated at least 3 times.
 On M/T models, shift gears following "suggested upshift speeds" schedule below.

#### Pattern 4:

- Tests are performed after the engine has been operated for at least 17 minutes.
- The accelerator pedal must be held very steady during steady-state driving.
- If the accelerator pedal is moved, the test must be conducted all over again.
- \*1: Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH), then release the accelerator pedal and keep it released for more than 10 seconds. Depress the accelerator pedal until vehicle speed is 90 km/h (56 MPH) again.
- \*2: Operate the vehicle in the following driving pattern.
- 1) Decelerate vehicle to 0 km/h and let engine idle.
- 2) Repeat driving pattern shown below at least 10 times.
- During acceleration, hold the accelerator pedal as steady as possible. (The THROTL POS SEN value of CONSULT should be between 0.8 to 1.2V.)
- 3) Repeat steps 1 and 2 until the EGR system SRT is set.

\*3: Checking the vehicle speed with CONSULT or GST is advised.

\*4: The driving pattern may be omitted when "PURG FLOW P1447" is performed using the "DTC WORK SUPPORT" mode with CONSULT.

Emission-related Diagnostic Information (Cont'd)

\*5: The driving pattern may be omitted when "EVAP SML LEAK P0440" is performed using the "DTC WORK SUPPORT" mode with CONSULT.

\*6: The driving pattern may be omitted when all the followings are performed using the "DTC WORK SUP-PORT" mode with CONSULT.

- "EGR SYSTEM P0400"
- "EGR SYSTEM P1402"

\*7: The driving pattern may be omitted when "EGRC-BPT/VLV P0402" is performed using the "DTC WORK SUPPORT" mode with CONSULT.

## Suggested Transmission Gear Position for A/T Models

Set the selector lever in the "D" position with the overdrive switch turned ON.

#### NAEC0030S0304

#### Suggested upshift speeds for M/T models

NAEC0030S0306 Shown below are suggested vehicle speeds for shifting into a higher gear. These suggestions relate to fuel economy and vehicle performance. Actual upshift speeds will vary according to road conditions, the weather and individual driving habits.

4th to 5th	64 (40)	63 (39)	72 (45)	_

#### Suggested Maximum Speed in Each Gear

Downshift to a lower gear if the engine is not running smoothly, or if you need to accelerate.

 $\mathbb{A}\mathbb{X}$ 

NAEC0030\$0305

Do not exceed the maximum suggested speed (shown below) in any gear. For level road driving, use the highest gear suggested for that speed. Always observe posted speed limits and drive according to the road conditions to ensure safe operation. Do not over-rev the engine when shifting to a lower gear as it may cause engine damage or loss of vehicle control.

## TEST VALUE AND TEST LIMIT (GST ONLY — NOT APPLICABLE TO CONSULT)

The following is the information specified in Mode 6 of SAE J1979.

NAEC0030S04

The test value is a parameter used to determine whether a system/circuit diagnostic test is "OK" or "NG" while being monitored by the ECM during self-diagnosis. The test limit is a reference value which is specified as the maximum or minimum value and is compared with the test value being monitored.

Items for which these data (test value and test limit) are displayed are the same as SRT code items (30 test

items). These data (test value and test limit) are specified by Test ID (TID) and Component ID (CID) and can be displayed on the GST screen.

## HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION How to Erase DTC ( With CONSULT)

#### NOTE:

#### If the DTC is not for A/T related items (see EC-2), skip steps 2 through 4.

- 1. If the ignition switch stays "ON" after repair work, be sure to turn ignition switch "OFF" once. Wait at least 5 seconds and then turn it "ON" (engine stopped) again.
- 2. Turn CONSULT "ON" and touch "A/T".
- 3. Touch "SELF-DIAG RESULTS".
- Touch "ERASE". [The DTC in the TCM (Transmission control module) will be erased.] Then touch "BACK" twice.
- 5. Touch "ENGINE".
- 6. Touch "SELF-DIAG RESULTS".
- 7. Touch "ERASE". (The DTC in the ECM will be erased.)
- If DTCs are displayed for both ECM and TCM (Transmission control module), they need to be erased individually from the ECM and TCM (Transmission control module).

<sup>\*2:</sup> These numbers are prescribed by SAE J2012.

<sup>\*3:</sup> These are not displayed with GST.

<sup>\*4: 1</sup>st trip DTC No. is the same as DTC No.

Emission-related Diagnostic Information (Cont'd)

The emission related diagnostic information in the ECM can be erased by selecting "ERASE" in the "SELF-DIAG RESULTS" mode with CONSULT.

# How to Erase DTC ( With GST)

NOTE:

NAEC0030S0602

#### If the DTC is not for A/T related items (see EC-2), skip step 2.

- 1. If the ignition switch stays "ON" after repair work, be sure to turn ignition switch "OFF" once. Wait at least 5 seconds and then turn it "ON" (engine stopped) again.
- 2. Perform "SELF-DIAGNOSTIC PROCEDURE (Without CONSULT)" in AT section titled "TROUBLE DIAGNOSIS", "Self-diagnosis". (The engine warm-up step can be skipped when performing the diagnosis only to erase the DTC.)
- 3. Select Mode 4 with GST (Generic Scan Tool).

The emission related diagnostic information in the ECM can be erased by selecting Mode 4 with GST.

#### How to Erase DTC ( No Tools) NOTE:

NAEC0030S0603

#### If the DTC is not for A/T related items (see EC-2), skip step 2.

- 1. If the ignition switch stays "ON" after repair work, be sure to turn ignition switch "OFF" once. Wait at least 5 seconds and then turn it "ON" again.
- Perform "SELF-DIAGNOSTIC PROCEDURE (Without CONSULT)" in AT section titled "TROUBLE DIAGNOSIS", "Self-diagnosis".
  - (The engine warm-up step can be skipped when performing the diagnosis only to erase the DTC.)
- 3. Change the diagnostic test mode from Mode II to Mode I by turning the mode selector on the ECM. (See EC-59.)

The emission related diagnostic information in the ECM can be erased by changing the diagnostic test mode from Diagnostic Test Mode II to Mode I by turning the mode selector on the ECM.

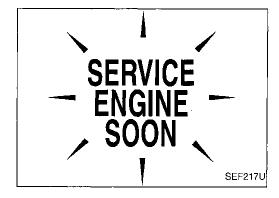

Emission-related Diagnostic Information (Cont'd)

- If the battery is disconnected, the emission-related diagnostic information will be lost after approx. 24 hours.
- Erasing the emission-related diagnostic information using CONSULT or GST is easier and quicker than switching the mode selector on the ECM.
- The following data are cleared when the ECM memory is erased.
- 1) Diagnostic trouble codes
- 2) 1st trip diagnostic trouble codes
- 3) Freeze frame data
- 4) 1st trip freeze frame data
- 5) System readiness test (SRT) codes
- 6) Test values
- 7) Others

Actual work procedures are explained using a DTC as an example. Be careful so that not only the DTC, but all of the data listed above, are cleared from the ECM memory during work procedures.

# Malfunction Indicator Lamp (MIL)

#### **DESCRIPTION**

The MIL is located on the instrument panel.

- 1. The MIL will light up when the ignition switch is turned ON without the engine running. This is a bulb check.
- If the MIL does not light up, refer to EL section ("WARNING LAMPS") or see EC-473.
- When the engine is started, the MIL should go off.If the MIL remains on, the on board diagnostic system has detected an engine system malfunction.

Malfunction Indicator Lamp (MIL) (Cont'd)

## On Board Diagnostic System Function

The on board diagnostic system has the following four functions.

=NAEC0031501

Diagnostic Test Mode	KEY and ENG. Status	Function	Explanation of Function
Mode I Ignition switch in "ON" position  Engine stopped		BULB CHECK	This function checks the MIL bulb for damage (blown, open circuit, etc.). If the MIL does not come on, check MIL circuit and ECM test mode selector. (See EC-59.)
	Engine running	MALFUNCTION WARNING	This is a usual driving condition. When a malfunction is detected twice in two consecutive driving cycles (two trip detection logic), the MIL will light up to inform the driver that a malfunction has been detected.  The following malfunctions will light up or blink the MIL in the 1st trip.  • "Misfire (Possible three way catalyst damage)"  • "Closed loop control"  • Fail-safe mode
Mode II	Ignition switch in "ON" position  Engine stopped	SELF-DIAGNOSTIC RESULTS	This function allows DTCs and 1st trip DTCs to be read.
	Engine running	FRONT HEATED OXYGEN SENSOR MONITOR	This function allows the fuel mixture condition (lean or rich), monitored by front heated oxygen sensor, to be read.

#### MIL Flashing without DTC

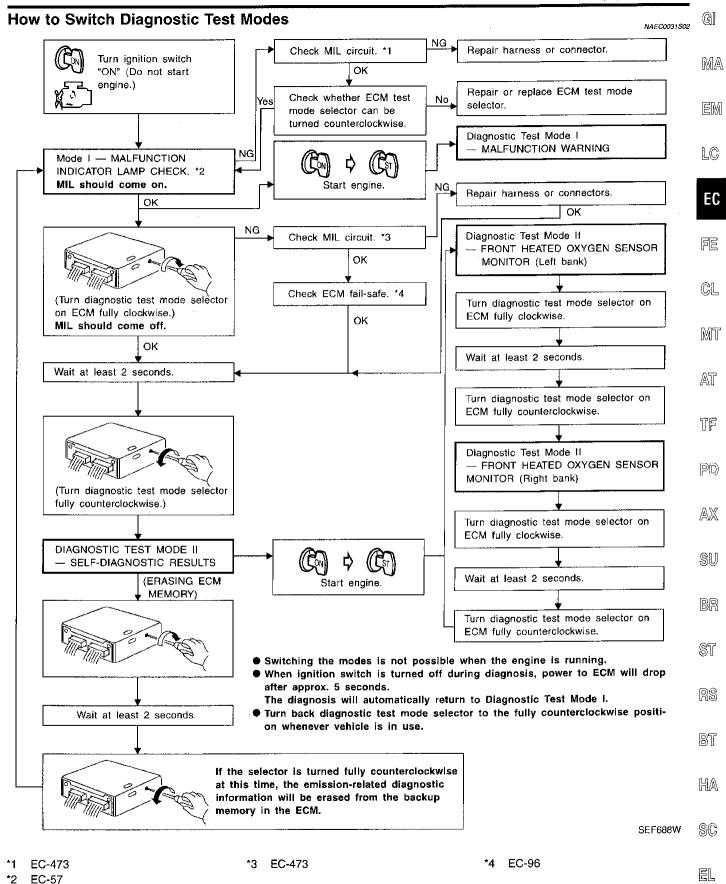

If the ECM is in Diagnostic Test Mode II, MIL may flash when engine is running. In this case, check ECM test mode selector following "How to Switch Diagnostic Test Modes", EC-59.

How to switch the diagnostic test (function) modes, and details of the above functions are described later. (Refer to EC-59.)

The following emission-related diagnostic information is cleared when the ECM memory is erased.

- 1) Diagnostic trouble codes
- 2) 1st trip diagnostic trouble codes
- 3) Freeze frame data
- 4) 1st trip freeze frame data
- 5) System readiness test (SRT) codes
- 6) Test values
- 7) Others

Malfunction Indicator Lamp (MIL) (Cont'd)

Mal

**EC-59** 245

Malfunction Indicator Lamp (MIL) (Cont'd)

#### Diagnostic Test Mode I — Bulb Check

NAEC003<u>18</u>0

In this mode, the MIL on the instrument panel should stay ON. If it remains OFF, check the bulb. Refer to EL section ("WARNING LAMPS") or see EC-473.

#### Diagnostic Test Mode I — Malfunction Warning

NAEC0031S04

MIL	Condition
ON	When the malfunction is detected or the ECM's CPU is malfunctioning.
OFF	No malfunction.

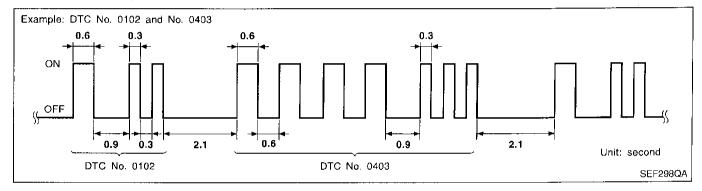

These DTC Numbers are clarified in Diagnostic Test Mode II (SELF-DIAGNOSTIC RESULTS).

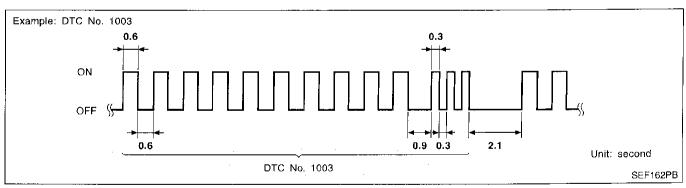

#### Diagnostic Test Mode II — Self-diagnostic Results

NAEC0031S05

In this mode, the DTC and 1st trip DTC are indicated by the number of blinks of the MIL.

The DTC and 1st trip DTC are displayed at the same time. If the MIL does not illuminate in diagnostic test mode I (Malfunction warning), all displayed items are 1st trip DTC's. If only one code is displayed when the MIL illuminates in diagnostic test mode II (SELF-DIAGNOSTIC RESULTS), it is a DTC; if two or more codes are displayed, they may be either DTC's or 1st trip DTC's. DTC No. is same as that of 1st trip DTC. These unidentified codes can be identified by using the CONSULT or GST. A DTC will be used as an example for how to read a code.

Long (0.6 second) blinking indicates the two LH digits of number and short (0.3 second) blinking indicates the two RH digits of number. For example, the MIL blinks 10 times for 6 seconds (0.6 sec x 10 times) and then it blinks three times for about 1 second (0.3 sec x 3 times). This indicates the DTC "1003" and refers to the malfunction of the park/neutral position switch.

In this way, all the detected malfunctions are classified by their DTC numbers. The DTC "0505" refers to no malfunction. (See TROUBLE DIAGNOSIS — INDEX, EC-2.)

#### How to Erase Diagnostic Test Mode II (Self-diagnostic Results)

NAEC0031S050

The DTC can be erased from the backup memory in the ECM when the diagnostic test mode is changed from Diagnostic Test Mode II to Diagnostic Test Mode I. (Refer to "How to Switch Diagnostic Test Modes", EC-59.)

- If the battery is disconnected, the DTC will be lost from the backup memory after approx. 24 hours.
- Be careful not to erase the stored memory before starting trouble diagnoses.

Malfunction Indicator Lamp (MIL) (Cont'd)

#### Diagnostic Test Mode II — Front Heated Oxygen Sensor Monitor

Gľ

In this mode, the MIL displays the condition of the fuel mixture (lean or rich) which is monitored by the front heated oxygen sensor.

MIL	Fuel mixture condition in the exhaust gas	Air fuel ratio feedback control condition	rol condition	
ON	Lean	Closed loop system	EM	
OFF	Rich	Closed loop system		
*Remains ON or OFF	Any condition	Open loop system	LC	

MA EM

\*: Maintains conditions just before switching to open loop.

To check the front heated oxygen sensor function, start engine in the Diagnostic Test Mode II and warm it up until engine coolant temperature indicator points to the middle of the gauge.

EC

Next run engine at about 2,000 rpm for about 2 minutes under no-load conditions. Then make sure that the MIL comes ON more than 5 times within 10 seconds with engine running at 2,000 rpm under no-load.

#### NVIS (Nissan Vehicle Immobiliser System — NATS)

If the security indicator lights up with the ignition switch in the "ON" position or "NATS MALFUNC-TION" is displayed on "SELF-DIAG RESULTS" screen, perform self-diagnostic results mode with CONSULT using NATS program card (NATS-E980U). Refer to "NVIS (Nissan Vehicle Immobiliser System — NATS" in EL section.

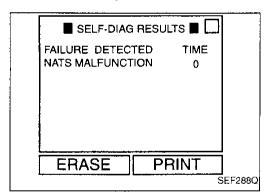

Confirm no self-diagnostic results of NATS is displayed before touching "ERASE" in "SELF-DIAG RESULTS" mode with CONSULT.

When replacing ECM, initialization of NATS system and registration of all NATS ignition key IDs must be carried out with CONSULT using NATS program card (NATS-E980U). Therefore, be sure to receive all keys from vehicle owner.

Regarding the procedures of NATS initialization and NATS ignition key ID registration, refer to CONSULT operation manual, NATS.

## OBD System Operation Chart

#### NAEC0032

## RELATIONSHIP BETWEEN MIL, 1ST TRIP DTC, DTC, AND DETECTABLE ITEMS

- When a malfunction is detected for the first time, the 1st trip DTC and the 1st trip freeze frame data are stored in the ECM memory.
- When the same malfunction is detected in two consecutive trips, the DTC and the freeze frame data are stored in the ECM memory, and the MIL will come on. For details, refer to "Two Trip Detection Logic" on EC-44.
- The MIL will go off after the vehicle is driven 3 times with no malfunction. The drive is counted only when the recorded driving pattern is met (as stored in the ECM). If another malfunction occurs while counting, the counter will reset.
- The DTC and the freeze frame data will be stored until the vehicle is driven 40 times (driving pattern A) without the same malfunction recurring (except for Misfire and Fuel Injection System). For Misfire and Fuel Injection System, the DTC and freeze frame data will be stored until the vehicle is driven 80 times (driving pattern C) without the same malfunction recurring. The "TIME" in "SELF-DIAGNOSTIC RESULTS" mode of CONSULT will count the number of times the vehicle is driven.
- The 1st trip DTC is not displayed when the self-diagnosis results in "OK" for the 2nd trip.

## RELATIONSHIP BETWEEN MIL, DTC, 1ST TRIP DTC AND DRIVING PATTERNS FOR "MISFIRE" <EXHAUST QUALITY DETERIORATION>, "FUEL INJECTION SYSTEM"

- \*1: When the same malfunction is detected in two consecutive trips, MIL will light up.
- \*2: MIL will go off after vehicle is driven 3 times (pattern B) without any malfunctions.
- \*3: When the same malfunction is detected in two consecutive trips, the DTC and the freeze frame data will be stored in ECM.
- \*4: The DTC and the freeze frame

data will not be displayed any longer after vehicle is driven 80 times (pattern C) without the same malfunction. (The DTC and the freeze frame data still remain in ECM.)

- \*5: When a malfunction is detected for the first time, the 1st trip DTC and the 1st trip freeze frame data will be stored in ECM.
- \*6: The 1st trip DTC and the 1st trip

freeze frame data will be cleared at the moment OK is detected.

- \*7: When the same malfunction is detected in the 2nd trip, the 1st trip freeze frame data will be cleared.
- 1st trip DTC will be cleared when vehicle is driven once (pattern C) without the same malfunction after DTC is stored in ECM.

SC

MA

EL

OBD System Operation Chart (Cont'd)

# EXPLANATION FOR DRIVING PATTERNS FOR "MISFIRE <EXHAUST QUALITY DETERIORATION>", "FUEL INJECTION SYSTEM"

#### <Driving Pattern B>

NAEC0032504 NAEC0032S0401

Driving pattern B means the vehicle operation as follows:

All components and systems should be monitored at least once by the OBD system.

- The B counter will be cleared when the malfunction is detected once regardless of the driving pattern.
- The B counter will be counted up when driving pattern B is satisfied without any malfunction.
- The MIL will go off when the B counter reaches 3. (\*2 in "OBD SYSTEM OPERATION CHART")

#### <Driving Pattern C>

NAEC0032S0402

Driving pattern C means the vehicle operation as follows:

- 1) The following conditions should be satisfied at the same time:
  Engine speed: (Engine speed in the freeze frame data) ±375 rpm
  Calculated load value: (Calculated load value in the freeze frame data) x (1±0.1) [%]
  Engine coolant temperature (T) condition:
- When the freeze frame data shows lower than 70°C (158°F), "T" should be lower than 70°C (158°F).
- When the freeze frame data shows higher than or equal to 70°C (158°F), "T" should be higher than or equal to 70°C (158°F).

#### Example:

If the stored freeze frame data is as follows:

Engine speed: 850 rpm, Calculated load value: 30%, Engine coolant temperature: 80°C (176°F)

To be satisfied with driving pattern C, the vehicle should run under the following conditions:

Engine speed: 475 - 1,225 rpm, Calculated load value: 27 - 33%, Engine coolant temperature: more than 70°C (158°F)

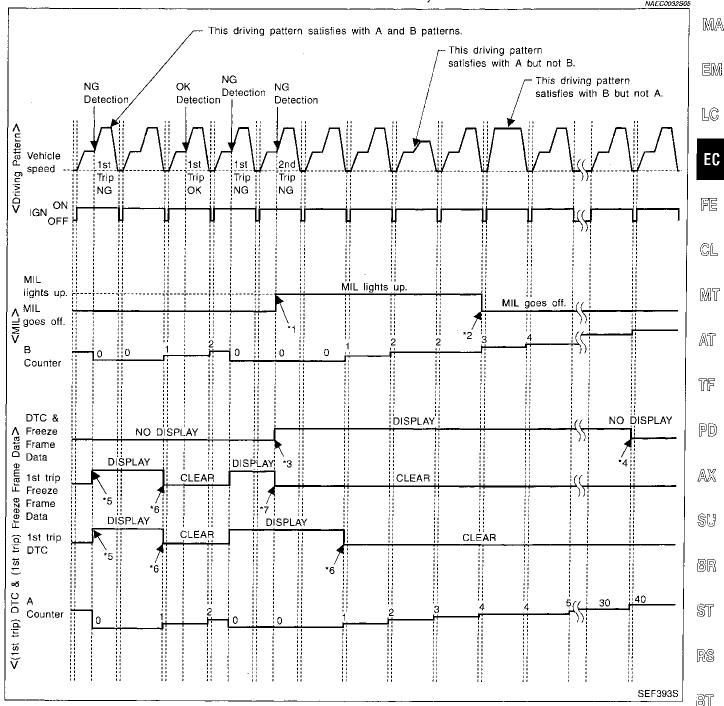

- The C counter will be cleared when the malfunction is detected regardless of (1).
- The C counter will be counted up when (1) is satisfied without the same malfunction.
- The DTC will not be displayed after C counter reaches 80.
- The 1st trip DTC will be cleared when C counter is counted once without the same malfunction after DTC is stored in ECM.

OBD System Operation Chart (Cont'd)

**G** 

EC

#### RELATIONSHIP BETWEEN MIL, DTC, 1ST TRIP DTC AND DRIVING PATTERNS <u>EXCEPT</u> FOR "MISFIRE <EXHAUST QUALITY DETERIORATION>", "FUEL INJECTION SYSTEM"

- \*1: When the same malfunction is detected in two consecutive trips, MIL will light up.
- MIL will go off after vehicle is driven 3 times (pattern B) without any malfunctions.
- When the same malfunction is detected in two consecutive trips, the DTC and the freeze frame data will be stored in ECM.
- The DTC and the freeze frame data will not be displayed any longer after vehicle is driven 40 times (pattern A) without the same malfunction. (The DTC and the freeze frame data still remain in ECM.)
- When a malfunction is detected for the first time, the 1st trip DTC
- and the 1st trip freeze frame data will be stored in ECM.
- \*6: 1st trip DTC will be cleared after vehicle is driven once (pattern B) without the same malfunction.
- \*7: When the same malfunction is detected in the 2nd trip, the 1st trip freeze frame data will be cleared.

EL

IDX

## REAL TIME DIAGNOSIS IN DATA MONITOR MODE (RECORDING VEHICLE DATA)

NAEC0033S

CONSULT has two kinds of triggers and they can be selected by touching "SETTING" in "DATA MONITOR" mode.

- 1) "AUTO TRIG" (Automatic trigger):
- The malfunction will be identified on the CONSULT screen in real time.

In other words, DTC/1st trip DTC and malfunction item will be displayed at the moment the malfunction is detected by ECM. DATA MONITOR can be performed continuously until a malfunction is detected. However, DATA MONITOR cannot continue any longer after the malfunction detection.

- "MANU TRIG" (Manual trigger):
- DTC/1st trip DTC and malfunction item will not be displayed automatically on CONSULT screen even though a malfunction

CONSULT (Cont'd)

Gi

RS

31

HA

SC

EL

is detected by ECM.

DATA MONITOR can be performed continuously even though a malfunction is detected.

Use these triggers as follows:

1) "AUTO TRIG"

 While trying to detect the DTC/1st trip DTC by performing the "DTC Confirmation Procedure", be sure to select to "DATA MONITOR (AUTO TRIG)" mode. You can confirm the malfunction at the moment it is detected.

While narrowing down the possible causes, CONSULT should be set in "DATA MONITOR (AUTO TRIG)" mode, especially in case the incident is intermittent.

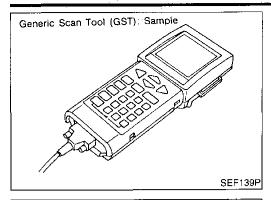

When you are inspecting the circuit by gently shaking (or twisting) the suspicious connectors, components and harness in the "DTC Confirmation Procedure", the moment a malfunction is found the DTC/1st trip DTC will be displayed. (Refer to GI section, "Incident Simulation Tests" in "HOW TO PERFORM EFFICIENT DIAGNOSIS FOR AN ELECTRICAL INCIDENT".)

2) "MANU TRIG"

 If the malfunction is displayed as soon as "DATA MONITOR" is selected, reset CONSULT to "MANU TRIG". By selecting "MANU TRIG" you can monitor and store the data. The data can be utilized for further diagnosis, such as a comparison with the value for the normal operating condition.

**EC-79** 265

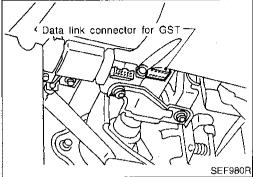

# Generic Scan Tool (GST) DESCRIPTION

NAEC0034

Generic Scan Tool (OBDII scan tool) complying with SAE J1978 has 7 different functions explained on the next page. ISO9141 is used as the protocol.

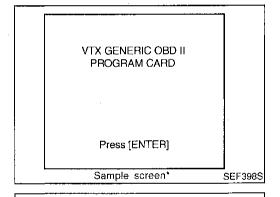

The name "GST" or "Generic Scan Tool" is used in this service manual.

#### **GST INSPECTION PROCEDURE**

NAEC0034S02

- 1. Turn off ignition switch.
- Connect "GST" to data link connector for GST. (Data link connector for GST is located under LH dash panel near the fuse box cover.)

**OBD II FUNCTIONS** 

F9: UNIT CONVERSION

Sample screen\*

- 3. Turn on ignition switch.
- 4. Enter the program according to instruction on the screen or in the operation manual.
- (\*: Regarding GST screens in this section, sample screens are shown.)

FO: DATA LIST
F1: FREEZE DATA
F2: DTCS
F3: SNAPSHOT
F4: CLEAR DIAG INFO
F5: O2 TEST RESULTS
F6: READINESS TESTS
F7: ON BOARD TESTS
F8: EXPAND DIAG PROT

SEF416S

5. Perform each diagnostic mode according to each service procedure.

For further information, see the GST Operation Manual of the tool maker.

Generic Scan Tool (GST) (Cont'd)

FUNCTION NAEC0034503			
Di	agnostic test mode	Function	
MODE 1	READINESS TESTS	This mode gains access to current emission-related data values, including analog inputs and outputs, digital inputs and outputs, and system status information.	
MODE 2	(FREEZE DATA)	This mode gains access to emission-related data value which were stored by ECM during the freeze frame. [For details, refer to "Freeze Frame Data" (EC-71).]	
MODE 3	DTCs	This mode gains access to emission-related power train trouble codes which were stored by ECM.	
MODE 4	CLEAR DIAG INFO	This mode can clear all emission-related diagnostic information. This includes:  Clear number of diagnostic trouble codes (MODE 1)  Clear diagnostic trouble codes (MODE 3)  Clear trouble code for freeze frame data (MODE 1)  Clear freeze frame data (MODE 2)  Reset status of system monitoring test (MODE 1)  Clear on board monitoring test results (MODE 6 and 7)	
MODE 6	(ON BOARD TESTS)	This mode accesses the results of on board diagnostic monitoring tests of specific components/systems that are not continuously monitored.	
MODE 7	(ON BOARD TESTS)	This mode enables the off board test drive to obtain test results for emission-related powertrain components/systems that are continuously monitored during normal driving conditions.	
MODE 8		This mode can close EVAP system in ignition switch "ON" position (Engine stopped).  When this mode is performed, the following parts can be opened or closed.  EVAP canister vent control valve open  Vacuum cut valve bypass valve closed In the following conditions, this mode cannot function.  Low ambient temperature  Low battery voltage  Engine running  Ignition switch "OFF"  Low fuel temperature	
		Too much pressure is applied to EVAP system

#### TROUBLE DIAGNOSIS — INTRODUCTION

Introduction

#### Introduction

The engine has an ECM to control major systems such as fuel control, ignition control, idle air control system, etc. The ECM accepts input signals from sensors and instantly drives actuators. It is essential that both input and output signals are proper and stable. At the same time, it is important that there are no problems such as vacuum leaks, fouled spark plugs, or other problems with the engine.

It is much more difficult to diagnose a problem that occurs intermittently rather than continuously. Most intermittent problems are caused by poor electric connections or improper wiring. In this case, careful checking of suspected circuits may help prevent the replacement of good parts.

A visual check only may not find the cause of the problems. A road test with CONSULT (or GST) or a circuit tester connected should be performed. Follow the "Work Flow" on EC-84.

Before undertaking actual checks, take a few minutes to talk with a customer who approaches with a driveability complaint. The customer can supply good information about such problems, especially intermittent ones. Find out what symptoms are present and under what conditions they occur. A "Diagnostic Worksheet" like the example on next page should be used.

Start your diagnosis by looking for "conventional" problems first. This will help troubleshoot driveability problems on an electronically controlled engine vehicle.

#### **KEY POINTS**

WHAT ..... Vehicle & engine model
WHEN ..... Date, Frequencies
WHERE..... Road conditions
HOW ..... Operating conditions,
Weather conditions,
Symptoms

SEF907L

#### DIAGNOSTIC WORKSHEET

There are many operating conditions that lead to the malfunction of engine components. A good grasp of such conditions can make trouble-shooting faster and more accurate.

In general, each customer feels differently about a problem. It is important to fully understand the symptoms or conditions for a customer complaint.

Utilize a diagnostic worksheet like the one on the next page in order to organize all the information for troubleshooting.

Some conditions may cause the MIL to come on steady or blink and DTC to be detected. Examples:

- Vehicle ran out of fuel, which caused the engine to misfire.
- Fuel filler cap was left off or incorrectly screwed on, allowing fuel to evaporate into the atmosphere [for the models with EVAP (SMALL LEAK) diagnosis].

268 **EC-82** 

## TROUBLE DIAGNOSIS — INTRODUCTION

## TROUBLE DIAGNOSIS — INTRODUCTION

Work Flow (Cont'd)

DESCRIPTION FOR WORK FLOW NAEC0036S01				
STEP	DESCRIPTION			
STEPI	Get detailed information about the conditions and the environment when the incident/symptom occurred using the "DIAGNOSTIC WORK SHEET", EC-83.			
STEP II	Before confirming the concern, check and write down (print out using CONSULT or GST) the (1st trip) DTC and the (1st trip) freeze frame data, then erase the DTC and the data. (Refer to EC-55.) The (1st trip) DTC and the (1st trip) freeze frame data can be used when duplicating the incident at STEP III & IV. If the incident cannot be verified, perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-115. Study the relationship between the cause, specified by (1st trip) DTC, and the symptom described by the customer. (The "Symptom Matrix Chart" will be useful. See EC-97.)  Also check related service bulletins for information.			
STEP III	Try to confirm the symptom and under what conditions the incident occurs.  The "DIAGNOSTIC WORK SHEET" and the freeze frame data are useful to verify the incident. Connect CONSULT to the vehicle in DATA MONITOR (AUTO TRIG) mode and check real time diagnosis results. If the incident cannot be verified, perform "TROUBLE DIAGNOSIS FOR INTERMITTENT (NCIDENT", EC-115. If the malfunction code is detected, skip STEP IV and perform STEP V.			
STEP IV	Try to detect the (1st trip) DTC by driving in (or performing) the "DTC Confirmation Procedure". Check and read the (1st trip) DTC and (1st trip) freeze frame data by using CONSULT or GST.  During the (1st trip) DTC verification, be sure to connect CONSULT to the vehicle in DATA MONITOR (AUTO TRIG) mode and check real time diagnosis results.  If the incident cannot be verified, perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-115. In case the "DTC Confirmation Procedure" is not available, perform the "Overall Function Check" instead. The (1st trip) DTC cannot be displayed by this check, however, this simplified "check" is an effective alternative. The "NG" result of the "Overall Function Check" is the same as the (1st trip) DTC detection.			
STEP V	Take the appropriate action based on the results of STEP I through IV.  If the malfunction code is indicated, proceed to TROUBLE DIAGNOSIS FOR DTC PXXXX.  If the normal code is indicated, proceed to the BASIC INSPECTION. (Refer to EC-86.) Then perform inspections according to the Symptom Matrix Chart. (Refer to EC-97.)			
STEP VI	Identify where to begin diagnosis based on the relationship study between symptom and possible causes. Inspect the system for mechanical binding, loose connectors or wiring damage using (tracing) "Harness Layouts". Gently shake the related connectors, components or wiring harness with CONSULT set in "DATA MONITOR (AUTO TRIG)" mode.  Check the voltage of the related ECM terminals or monitor the output data from the related sensors with CONSULT. Refer to EC-101, EC-106.  The "Diagnostic Procedure" in EC section contains a description based on open circuit inspection. A short circuit inspection is also required for the circuit check in the Diagnostic Procedure. For details, refer to GI section ("HOW TO PERFORM EFFICIENT DIAGNOSIS FOR AN ELECTRICAL INCIDENT", "Circuit Inspection"). Repair or replace the malfunction parts.  If malfunctioning part cannot be detected, perform "TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT", EC-115.			
STEP VII	Once you have repaired the circuit or replaced a component, you need to run the engine in the same conditions and circumstances which resulted in the customer's initial complaint.  Perform the "DTC Confirmation Procedure" and confirm the normal code [DTC No. P0000 or 0505] is detected. If the incident is still detected in the final check, perform STEP VI by using a different method from the previous one.  Before returning the vehicle to the customer, be sure to erase the unnecessary (already fixed) (1st trip) DTC in ECM and TCM (Transmission control module). (Refer to EC-55.)

## 7 CHECK CLOSED THROTTLE POSITION SWITCH IDLE POSITION-II

- 1. Turn ignition switch "ON".
- 2. Select "CLSD THL/P SW" in "DATA MONITOR" mode.
- Read "CLSD THL/P SW" signal under the following conditions.
- Insert a 0.3 mm (0.012 in) and 0.4 mm (0.016 in) feeler gauge alternately between the throttle adjust screw (TAS) and throttle drum as shown in the figure and check the signal

SEF577W

"CLSD THL/P SW" signal should remain "ON" while inserting 0.3 mm (0.012 in) feeler gauge. "CLSD THL/P SW" signal should remain "OFF" while inserting 0.4 mm (0.016 in) feeler gauge.

#### OK or NG

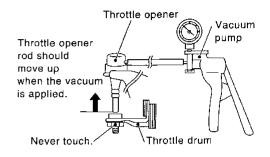

ок	<b></b>	GO TO 12.

## 8 ADJUSTMENT THROTTLE POSITION SWITCH IDLE POSITION

### With CONSULT

#### NOTE:

- Never adjust throttle adjust screw (TAS).
- Do not touch throttle drum when checking "CLSD THL/P SW" signal, doing so may cause an incorrect adjustment
- 1. Warm up engine to normal operating temperature.
- 2. Check FI cam. Refer to procedure 3.
- 3. Stop engine.
- 4. Loosen throttle position sensor fixing bolts.
- 5. Remove the vacuum hose connected to the throttle opener.
- Connect suitable vacuum hose to vacuum pump as shown below.

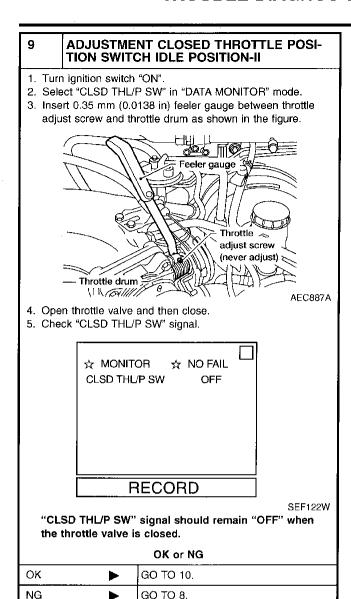

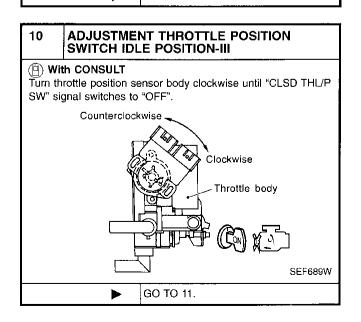

SEF793V

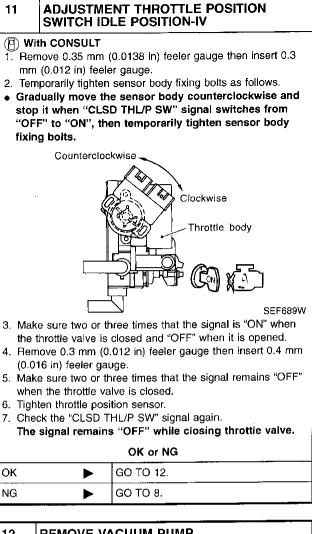

Apply vacuum [more than -40.0 kPa (-300 mmHg, -11.82 inHg)] until the throttle drum becomes free from the rod of the throttle opener. During adjustment procedure, vacuum should be applied.

■ GO TO 9.

Basic Inspection (Cont'd)

## 19 CHECK CLOSED THROTTLE POSITION SWITCH IDLE POSITION

## Without CONSULT

NOTE:

Always check ignition timing and base idle speed before performing the following.

- 1. Warm up engine to normal operating temperature.
- 2. Check FI cam, refer to procedure 12 or 13.
- 3. Stop engine.
- 4. Remove the vacuum hose connected to the throttle opener.
- Connect suitable vacuum hose to vacuum pump as shown below

SEF793W

 Apply vacuum [more than -40.0 kPa (-300 mmHg, -11.81 inHg)] until the throttle drum becomes free from the rod of the throttle opener. During checking procedure, vacuum should be applied.

GO TO 20.

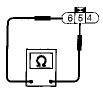

## 20 CHECK CLOSED THROTTLE POSITION SWITCH IDLE POSITION-I

- Disconnect closed throttle position switch harness connector.
- Check continuity between closed throttle position switch terminals 5 and 6 under the following conditions.

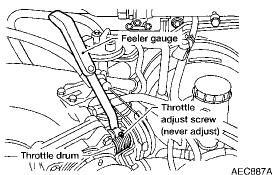

Closed throttle position switch connector

SEE862V

 Insert the 0.3 mm (0.012 in) and 0.4 mm (0.016 in) feeler gauge alternately between the throttle adjust screw (TAS) and throttle drum as shown in the figure.

"Continuity should exist" while inserting 0.3 mm (0.012

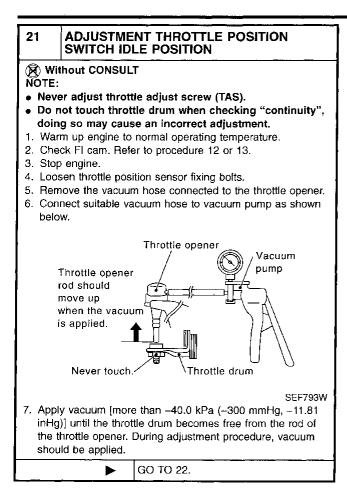

in) feeler gauge.
"Continuity should not exist" while inserting 0.4 mm

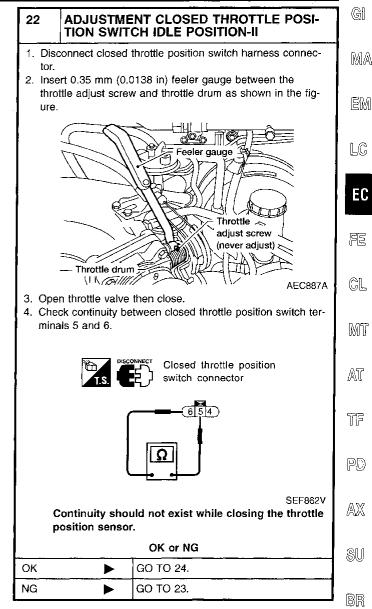

(0.016 in) feeler gauge.

Basic Inspection (Cont'd)

## 24 ADJUSTMENT THROTTLE POSITION SWITCH IDLE POSITION-IV

#### (R) Without CONSULT

- 1. Remove 0.35 mm (0.0138 in) feeler gauge then insert 0.3 mm (0.012 in) feeler gauge.
- 2. Temporarily tighten sensor body fixing bolts as follows.
- Gradually move the sensor body counterclockwise and stop it when the continuity comes to exist, then temporarily tighten sensor body fixing bolts.

SEF689W

- Make sure two or three times that the continuity exists when the throttle valve is closed and continuity does not exist when it is opened.
- 4. Remove 0.3 mm (0.012 in) feeler gauge then insert 0.4 mm (0.016 in) feeler gauge.
- Make sure two or three times that the continuity does not exist when the throttle valve is closed.
- 6. Tighten throttle position sensor.
- 7. Check the continuity again.

Continuity does not exist while closing the throttle valve.

#### OK or NG

ОК	<b>&gt;</b>	GO TO 25.
NG	<b></b>	GO TO 21.

#### 25 REINSTALLATION

#### (R) Without CONSULT

- 1. Remove feeler gauge.
- 2. Release vacuum from the throttle opener.
- Remove vacuum pump and vacuum hose from the throttle opener.
- Reinstall the original vacuum hose to the throttle opener securely.
- Reconnect throttle position sensor harness connector and closed throttle position switch harness connector.
- Start engine and rev it (2,000 to 3,000 rpm) two or three times under no-load and then run engine at idle speed.

■ GO TO 26.

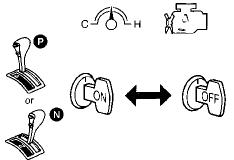

## 26 RESET THROTTLE POSITION SENSOR IDLE POSITION MEMORY

#### Without CONSULT

#### NOTE

Always warm up engine to normal operating temperature. If engine is cool, the throttle position sensor idle position memory will not be reset correctly.

- 1. Start engine.
- 2. Warm up engine to normal operating temperature.
- 3. Stop engine. (Turn ignition switch "OFF".)
- 4. Turn ignition switch "ON" and wait at least 5 seconds.

SEF864V

- 5. Turn ignition switch "OFF" and wait at least 5 seconds.
- 6. Repeat steps 4 and 5, 20 times.

► GO TO 27.

#### 27 CHECK TARGET IDLE SPEED

#### (R) Without CONSULT

- Start engine and warm it up to normal operating temperature.
- 2. Check idle speed.

750±50 rpm (in "P" or "N" position)

#### OK or NG

ОК	<b>•</b>	GO TO 28.
NG	>	Adjust idle speed. Refer to "Idle Speed/Ignition Timing/Idle Mixture Ratio Adjustment", EC-35.

#### 28 ERASE UNNECESSARY DTC

After this inspection, unnecessary DTC No. might be displayed.

Erase the stored memory in ECM and TCM (Transmission control module).

Refer to "HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION", EC-55 and "HOW TO ERASE DTC" in AT section.

► INSPECTION END

SC

### **Fail-safe Chart**

The ECM enters fail-safe mode, if any of the following malfunctions is detected due to the open or short circuit. When the ECM enters the fail-safe mode, the MIL illuminates.

DTC No.										
CONSULT GST	ECM*1	Detected items	Engine operating condition in fall-safe mode							
P0100	0102	Mass air flow sensor circuit	Engine speed will not rise more than 2,400 rpm due to the fuel cut.							
P0115	0103	Engine coolant temperature sensor circuit	Engine coolant temperature will be determined by ECM based on the time after turning ignition switch "ON" or "START".  CONSULT displays the engine coolant temperature decided by ECM.							
	5  -5  -5  -5		Condition	Engine coolant temperature decided (CONSULT display)						
			Just as ignition switch is turned ON or Start	40°C (104°F)						
			More than approx. 4 minutes after ignition ON or Start	80°C (176°F)						
			Except as shown above	40 - 80°C (104 - 176°F) (Depends on the time)						
P0120	0403	Throttle position sensor circuit	Throttle position will be determ the engine speed. Therefore, acceleration will be	ined based on the injected fuel amount and poor.						
			Condition	Driving condition						
			When engine is idling	Normal						
			When accelerating	Poor acceleration						
Unable to access ECM	Unable to access Diagnostic Test Mode	ECM	ECM fail-safe activating condition  The computing function of the ECM was judged to be malfunctioning.  When the fail-safe system activates (i.e., if the ECM detects a malfunction condition in the CPU of ECM), the MIL on the instrument panel lights to warn the driver.  However it is not possible to access ECM and DTC cannot be confirmed.  Engine control with fail-safe  When ECM fail-safe is operating, fuel injection, ignition timing, fuel pump operation, and IACV-AAC valve operation are controlled under certain limitations.							
				ECM fail-safe operation						
			Engine speed	Engine speed will not rise more than 3,000 rpm						
			Fuel injection	Simultaneous multiport fuel injection system						
[		ļ	Ignition timing	Ignition timing is fixed at the preset valve						
			Fuel pump	Fuel pump relay is "ON" when engine is running and "OFF" when engine stalls						
			IACV-AAC valve	Full open						
			Replace ECM, if ECM fail-safe condition is confirmed.							

<sup>\*1:</sup> In Diagnostic Test Mode II (Self-diagnostic results)

CONSULT Reference Value in Data Monitor Mode

# CONSULT Reference Value in Data Monitor Mode

NAEC0041

Gl

MA

EM

Remarks:

- Specification data are reference values.
- Specification data are output/input values which are detected or supplied by the ECM at the connector.
  - \* Specification data may not be directly related to their components signals/values/operations.

i.e. Adjust ignition timing with a timing light before monitoring IGN TIMING, because the monitor may show the specification data in spite of the ignition timing not being adjusted to the specification data. This IGN TIMING monitors the data calculated by the ECM according to the signals input from the camshaft position sensor and other ignition timing related sensors.

• If the real-time diagnosis results are NG and the on board diagnostic system results are OK when diagnosing the mass air flow sensor, first check to see if the fuel pump control circuit is normal.

# Major Sensor Reference Graph in Data Monitor Mode

NAEC0042

CL

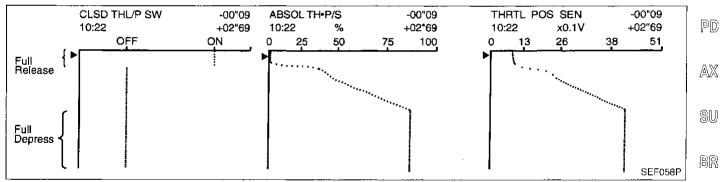

MT

The following are the major sensor reference graphs in "DATA MONITOR" mode. (Select "HI SPEED" in "DATA MONITOR" with CONSULT.)

#### THRTL POS SEN, ABSOL TH.P/S, CLSD THL/P SW

Below is the data for "THRTL POS SEN", "ABSOL TH-P/S" and "CLSD THL/P SW" when depressing the accelerator pedal with the ignition switch "ON".

The signal of "THRTL POS SEN" and "ABSOL TH-P/S" should rise gradually without any intermittent drop or rise after "CLSD THL/P SW" is changed from "ON" to "OFF".

# CMPS·RPM (REF), MAS AIR/FL SE, THRTL POS SEN, RR O2 SEN-B1, FR O2 SEN-B1, INJ PULSE-B1

Below is the data for "CMPS-RPM (REF)", "MAS AIR/FL SE", "THRTL POS SEN", "RR O2 SEN-B1", "FR O2 SEN-B1" and "INJ PULSE-B1" when revving engine quickly up to 4,800 rpm under no load after warming up engine sufficiently.

Each value is for reference, the exact value may vary.

ECM Terminals and Reference Value

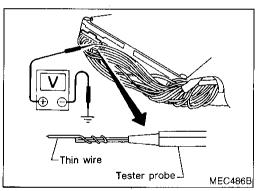

# **ECM Terminals and Reference Value PREPARATION**

NAEC0043

- 1. ECM is located behind the instrument lower cover. For this inspection:
- Remove instrument lower cover.

Remove ECM harness protector.

- Perform all voltage measurements with the connector connected. Extend tester probe as shown to perform tests easily.
- Open harness securing clip to make testing easier.
- Use extreme care not to touch 2 pins at one time.
- Data is for comparison and may not be exact.

#### TROUBLE DIAGNOSIS FOR INTERMITTENT INCIDENT

Description

#### Description

G

Intermittent incidents (I/I) may occur. In many cases, the problem resolves itself (the part or circuit function returns to normal without intervention). It is important to realize that the symptoms described in the customer's complaint often do not recur on (1st trip) DTC visits. Realize also that the most frequent cause of I/I occurrences is poor electrical connections. Because of this, the conditions under which the incident occurred may not be clear. Therefore, circuit checks made as part of the standard diagnostic procedure may not indicate the specific problem area.

MA

EM

#### COMMON I/I REPORT SITUATIONS

NAEC0388\$01

STEP in Work Flow	Situation	
	The CONSULT is used. The SELF-DIAG RESULTS screen shows time data other than "0" or "[1t]".	
10	The symptom described by the customer does not recur.	
IV	(1st trip) DTC does not appear during the DTC Confirmation Procedure.	
VI	The Diagnostic Procedure for PXXXX does not indicate the problem area.

Component Description

## **Component Description**

The mass air flow sensor is placed in the stream of intake air. It measures the intake flow rate by measuring a part of the entire intake flow. It consists of a hot wire that is supplied with electric current from the ECM. The temperature of the hot wire is controlled by the ECM a certain amount. The heat generated by the hot wire is reduced as the intake air flows around it. The more air, the greater the heat loss.

Therefore, the ECM must supply more electric current to maintain the temperature of the hot wire as air flow increases. The ECM detects the air flow by means of this current change.

## **CONSULT Reference Value in Data Monitor** Mode

Specification data are reference values.

NAECO048

MONITOR ITEM	CONDITION		SPECIFICATION
MAS AIR/FL SE	Engine: After warming up     Air conditioner switch: "OFF"	Idle	1.0 - 1.7V

## DTC P0115 ENGINE COOLANT TEMPERATURE SENSOR (ECTS) (CIRCUIT)

Component Description

## **Component Description**

The engine coolant temperature sensor is used to detect the engine coolant temperature. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the engine coolant temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.

#### <Reference data>

## MA

#### COMPONENT DESCRIPTION

The throttle position sensor responds to the accelerator pedal movement. This sensor is a kind of potentiometer which transforms the throttle position into output voltage, and emits the voltage signal to the ECM. In addition, the sensor detects the opening and closing speed of the throttle valve and feeds the voltage signal to the ECM.

LC.

Idle position of the throttle valve is determined by the ECM receiving the signal from the throttle position sensor. This sensor controls engine operation such as fuel cut. On the other hand, the "Wide open and closed throttle position switch", which is built into the throttle position sensor unit, is not used for engine control.

### **Description**

#### NOTE:

NAEC0081

 If DTC P0125 (0908) is displayed with P0115 (0103), first perform "DTC P0115 ENGINE COOLANT TEMPERATURE (ECTS) SENSOR", EC-146.

#### COMPONENT DESCRIPTION

NAEC0081S0

The engine coolant temperature sensor is used to detect the engine coolant temperature. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the engine coolant temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.

#### <Reference data>

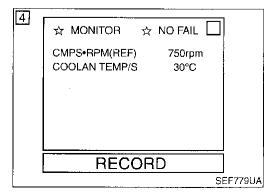

Engine coolant temperature °C (°F)	Voltage* (V)	Resistance (kΩ)
-10 (14)	4.4	9.2
20 (68)	3.5	2.1 - 2.9

Component Description

## Component Description

The front heated oxygen sensor is placed into the front tube. It detects the amount of oxygen in the exhaust gas compared to the outside air. The front heated oxygen sensor has a closed-end tube made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions. The front heated oxygen sensor signal is sent to the ECM. The ECM adjusts the injection pulse duration to achieve the ideal airfuel ratio. The ideal air-fuel ratio occurs near the radical change from 1V to 0V.

On Board Diagnosis Logic

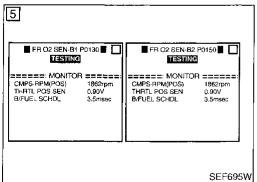

### On Board Diagnosis Logic

Under the condition in which the front heated oxygen sensor signal is not input, the ECM circuits will read a continuous approximately 0.3V. Therefore, for this diagnosis, the time that output voltage is within 200 to 400 mV range is monitored, and the diagnosis checks that this time is not inordinately long.

DTC No.	Malfunction is detected when	Check Items (Possible Cause)
P0130 0503 (Right bank)	The voltage from the sensor is constantly approx. 0.3V.	Harness or connectors     (The sensor circuit is open or shorted.)     Front heated oxygen sensor
P0150 0303 (Left bank)

## **DTC Confirmation Procedure**

NAFC0390

#### **CAUTION:**

Always drive vehicle at a safe speed.

#### NOTE:

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

#### **TESTING CONDITION:**

- Never raise engine speed above 3,200 rpm during the "DTC Confirmation Procedure". If the engine speed limit is exceeded, retry the procedure from step 2.
- Before performing the following procedure, confirm that battery voltage is more than 11V at idle.
- (P) With CONSULT
- 1) Start engine and warm it up to normal operating temperature.
- Select "FR O2 SEN-B1 (-B2) P0130 (P0150)" of "FRONT O2 SENSOR" in "DTC WORK SUPPORT" mode with CONSULT.
- 3) Touch "START".
- Let it idle for at least 3.5 minutes.
- 5) When the following conditions are met, "TESTING" will be displayed on the CONSULT screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take approximately 10 to 60 seconds.)

CMPS-RPM (REF)	1,800 - 2,600 rpm (A/T models) 1,900 - 2,700 rpm (M/T models)
Vehicle speed	70 - 120 km/h (43 - 75 MPH)
B/FUEL SCHDL	1.7 - 6.5 msec (A/T models) 1.4 - 5.5 msec (M/T models)
Selector lever	Suitable position

If "TESTING" is not displayed after 5 minutes, retry from step 2.

DTC Confirmation Procedure (Cont'd)

) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to "Diagnostic Procedure", EC-172.

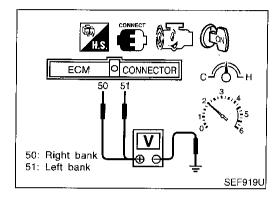

During this test, P1148 may be stored in ECM.

ĒM

LC

## **Overall Function Check**

Use this procedure to check the overall function of the front heated oxygen sensor circuit. During this check, a 1st trip DTC might not be confirmed.

FE

CL

#### **№** Without CONSULT

- 1) Start engine and warm it up to normal operating temperature.
- Set voltmeter probes between ECM terminal 50 (right bank sensor signal) or 51 (left bank sensor signal) and engine ground.

- Check the following with engine speed held at 2,000 rpm constant under no load.
- The voltage does not remain in the range of 0.2 0.4V.
- 4) If NG, go to "Diagnostic Procedure", EC-172.

## Component Inspection FRONT HEATED OXYGEN SENSOR

(A) With CONSULT

Start engine and warm it up to normal operating temperature.

Select "MANU TRIG" and "HI SPEED" in "DATA MONITOR" mode with CONSULT, and select "FR O2 SEN-B1 (-B2)" and "FR O2 MNTR-B1 (-B2)".

Hold engine speed at 2,000 rpm under no load during the following steps.

Touch "RECORD" on CONSULT screen. 4)

5) Check the following.

"FR O2 MNTR-B1 (-B2)" in "DATA MONITOR" mode changes from "RICH" to "LEAN" to "RICH" 5 times in 10 seconds. 5 times (cycles) are counted as shown left:

"FR O2 SEN-B1 (-B2)" voltage goes above 0.6V at least once.

"FR O2 SEN-B1 (-B2)" voltage goes below 0.3V at least once.

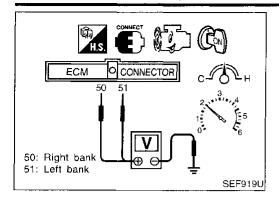

"FR O2 SEN-B1 (-B2)" voltage never exceeds 1.0V.

#### CAUTION:

Discard any heated oxygen sensor which has been dropped from a height of more than 0.5 m (19.7 in) onto a hard surface such as a concrete floor; use a new one.

09"05 2037 0.18	17:51 09"13 09"11	CMPS •RPM (REF) (rpm) 2050 2050	FR 02 SEN -B1 (V) 0.19 0.18	.01V -02	Maximum	\	~\ !	$\bigcap_{i \in I}$	<i>[</i>	1	<ul> <li>Maximum voltage should be over 0.6V at least one time.</li> </ul>

On Board Diagnosis Logic

### On Board Diagnosis Logic

To judge the malfunction of front heated oxygen sensor, this diagnosis measures front heated oxygen sensor cycling time. The time is compensated by engine operating (speed and load), fuel feedback control constant, and front heated oxygen sensor temperature index. Judgment is based on whether the compensated time (front heated oxygen sensor cycling time index) is inordinately long or not.

DTC No.	Malfunction is detected when	Check Items (Possible Cause)
P0133 0413 (Right bank)	The cycle of the voltage signal from the sensor is more than the specified time.	<ul> <li>Harness or connectors (The sensor circuit is open or shorted.)</li> <li>Front heated oxygen sensor</li> <li>Front heated oxygen sensor heater</li> <li>Fuel pressure</li> <li>Injectors</li> <li>Intake air leaks</li> </ul>
0409 (Left bank)		<ul><li>Exhaust gas leaks</li><li>PCV valve</li><li>Mass air flow sensor</li></ul>

# DTC Confirmation Procedure

NAEC0414

#### **CAUTION:**

Always drive vehicle at a safe speed.

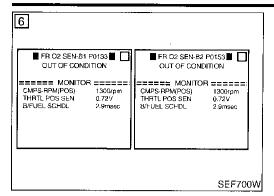

#### NOTE

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

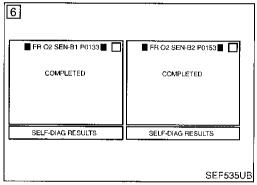

### **TESTING CONDITION:**

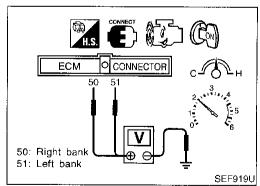

- Always perform at a temperature above -10°C (14°F).
- Before performing the following procedure, confirm that battery voltage is more than 11V at idle.

DTC Confirmation Procedure (Cont'd)

6	
FR O2 SEN-81 P0133	FR O2 SEN-82 P0153
MONITOR	=====: MONITOR ======: CMPS RPM(POS) 1862rpm THRTL, POS SEN 0,90V B/FUEL SCHDL 3.5msec
	SEF701W

#### (P) With CONSULT

1) Start engine and warm it up to normal operating temperature.

Stop engine and wait at least 5 seconds.

 Turn ignition switch "ON" and select "FR O2 SEN-B1 (-B2) P0133 (P0153)" of "FRONT O2 SENSOR" in "DTC WORK SUPPORT" mode with CONSULT.

4) Touch "START".

5) Start engine and let it idle for at least 3.5 minutes.

#### NOTE:

Never raise engine speed above 3,200 rpm during the "DTC Confirmation Procedure". If the engine speed limit is exceeded, retry the procedure from step 5.

6) When the following conditions are met, "TESTING" will be displayed on the CONSULT screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take approximately 40 to 50 seconds.)

CMPS-RPM (REF)	1,800 - 2,800 rpm (A/T models) 1,900 - 3,300 rpm (M/T models)
Vehicle speed	80 - 120 km/h (50 - 75 MPH)
B/FUEL SCHDL	1.7 - 6.5 msec (A/T models) 1.4 - 5.5 msec (M/T models)
Selector lever	Suitable position

# If "TESTING" is not displayed after 5 minutes, retry from step 2.

7) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to "Diagnostic Procedure", EC-192.

### Overall Function Check

Use this procedure to check the overall function of the front heated oxygen sensor circuit. During this check, a 1st trip DTC might not be confirmed.

### Without CONSULT

- 1) Start engine and warm it up to normal operating temperature.
- Set voltmeter probes between ECM terminal 50 (right bank sensor signal) or 51 (left bank sensor signal) and engine ground.
- 3) Check the following with engine speed held at 2,000 rpm constant under no load.
- MIL goes on more than 5 times within 10 seconds in Diagnostic Test Mode II (FRONT HEATED OXYGEN SENSOR MONI-TOR).
- 4) If NG, go to "Diagnostic Procedure", EC-192.

Component Description

### **Component Description**

The front heated oxygen sensor is placed into the front tube. It detects the amount of oxygen in the exhaust gas compared to the outside air. The front heated oxygen sensor has a closed-end tube made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions. The front heated oxygen sensor signal is sent to the ECM. The ECM adjusts the injection pulse duration to achieve the ideal airfuel ratio. The ideal air-fuel ratio occurs near the radical change from 1V to 0V.

# DTC P0137 (RIGHT BANK, -B1), P0157 (LEFT BANK, -B2) REAR HEATED OXYGEN SENSOR (REAR HO2S) (MIN. VOLTAGE MONITORING)

Component Description

### Component Description

The rear heated oxygen sensor, after three way catalyst, monitors the oxygen level in the exhaust gas on each bank.

Even if switching characteristics of the front heated oxygen sensor are shifted, the air fuel ratio is controlled to stoichiometric, by the signal from the rear heated oxygen sensor.

This sensor is made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions.

Under normal conditions the rear heated oxygen sensor is not used for engine control operation.

### **CONSULT Reference Value in Data Monitor** Mode

Specification data are reference values.

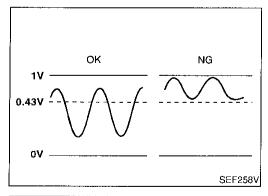

NAEC0106

MONITOR ITEM	CONDITION		SPECIFICATION
RR O2 SEN-B1 RR O2 SEN-B2	- Fasing Attackers	Revving engine from idle up to	0 - 0.3V ←→ Approx. 0.6 - 1.0V
RR O2 MNTR-B1 RR O2 MNTR-B2	Engine: After warming up	2,000 rpm	LEAN ←→ RICH

### **ECM Terminals and Reference Value**

Specification data are reference values and are measured between each terminal and 32 (ECM ground).

TERMI- NAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
56 (Right bank)	L/W	Rear heated oxygen sen- sor	[Engine is running]	O American Adala d OV
57 (Left bank)	w		Warm-up condition     Revving engine from idle up to 2,000 rpm	0 - Approximately 1.0V

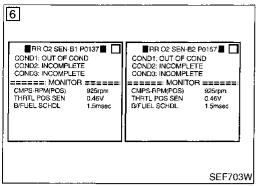

### On Board Diagnosis Logic

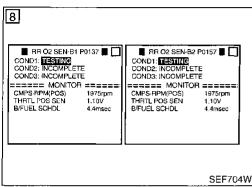

The rear heated oxygen sensor has a much longer switching time between rich and lean than the front heated oxygen sensor. The oxygen storage capacity before the three way catalyst causes the longer switching time. To judge the malfunctions of rear heated oxygen sensor, ECM monitors whether the minimum voltage of sensor is sufficiently low during the various driving condition such as fuel-cut.

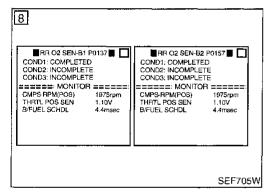

DTC No.	Malfunction is detected when	Check Items (Possible Cause)
P0137 0511 (Right bank) P0157 0314 (Left bank)	The minimum voltage from the sensor is not reached to the specified voltage.	<ul> <li>Harness or connectors (The sensor circuit is open or shorted.)</li> <li>Rear heated oxygen sensor</li> <li>Fuel pressure</li> <li>Injectors</li> </ul>

CAUTION:

DTC Confirmation Procedure

## **DTC Confirmation Procedure**

NAEC0435

Always drive vehicle at a safe speed.

**TESTING CONDITION:** 

Never stop engine during this test. If the engine is stopped, reperform this test from step 2 in "Procedure for COND1".

G

MA

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

"COMPLETED" will appear on CONSULT screen when all tests "COND1", "COND2" and "COND3" are completed.

LC

EC

(A) With CONSULT

#### Procedure for COND1

Start engine and warm it up to normal operating temperature.

Turn ignition switch "OFF" and wait at least 5 seconds. Turn ignition switch "ON" and select "RR O2 SEN-B1 (-B2) P0137 (P0157)" of "REAR O2 SENSOR" in "DTC WORK SUP-

CL

Touch "START". 4)

5) Start engine and let it idle for at least 30 seconds.

PORT" mode with CONSULT.

MT

Rev engine up to 2,000 rpm 2 or 3 times quickly under no load.

If "COMPLETED" appears on CONSULT screen, go to step 2 in "Procedure for COND3". If "COMPLETED" does not appear on CONSULT screen, go to the following step.

Drive vehicle at a speed of more than 70 km/h (43 MPH) for 2 consecutive minutes.

PD)

When the following conditions are met, "TESTING" will be displayed at "COND1" on the CONSULT screen. Maintain the conditions continuously until "TESTING" changes to "COM-PLETED". (It will take approximately 60 seconds.)

AX

CMPS-RPM (POS)	1,300 - 3,100 rpm (A/T) 1,500 - 3,600 rpm (M/T)

Component Description

### **Component Description**

NAEC043

The rear heated oxygen sensor, after three way catalyst, monitors the oxygen level in the exhaust gas on each bank.

Even if switching characteristics of the front heated oxygen sensor are shifted, the air fuel ratio is controlled to stoichiometric, by the signal from the rear heated oxygen sensor.

This sensor is made of ceramic zirconia. The zirconia generates voltage from approximately 1V in richer conditions to 0V in leaner conditions.

Under normal conditions the rear heated oxygen sensor is not used for engine control operation.

## **CONSULT Reference Value in Data Monitor Mode**

Specification data are reference values.

NAEC0438

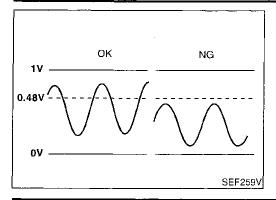

MONITOR ITEM	CONDITION		SPECIFICATION
RR O2 SEN-B1 RR O2 SEN-B2	Revving engine from idle up to	0 - 0.3V ←→ Approx. 0.6 - 1.0V	
RR O2 MNTR-B1 RR O2 MNTR-B2	Engine: After warming up	2,000 mm	LEAN ←→ RICH

### **ECM Terminals and Reference Value**

NAEC0439

Specification data are reference values and are measured between each terminal and 32 (ECM ground).

TERMI- NAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
56 (Right bank)	L/W	Rear heated oxygen sen- sor	[Engine is running]	0. 4
57 (Left bank)	w		Warm-up condition     Revving engine from idle up to 2,000 rpm	0 - Approximately 1.0V

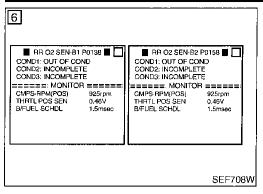

### On Board Diagnosis Logic

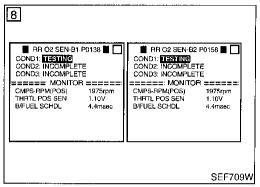

NAEC04

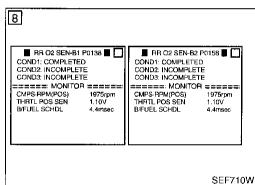

The rear heated oxygen sensor has a much longer switching time between rich and lean than the front heated oxygen sensor. The oxygen storage capacity before the three way catalyst causes the longer switching time. To judge the malfunctions of rear heated oxygen sensor, ECM monitors whether the maximum voltage of the sensor is sufficiently high during the various driving condition such as fuel-cut.

DTC No.	Malfunction is detected when	Check Items (Possible Cause)
P0138 0510 (Right bank) P0158 0313 (Left bank)	The maximum voltage from the sensor is not reached to the specified voltage.	<ul> <li>Harness or connectors (The sensor circuit is open or shorted.)</li> <li>Rear heated oxygen sensor</li> <li>Fuel pressure</li> <li>Injectors</li> <li>Intake air leaks</li> </ul>

DTC Confirmation Procedure

### **DTC Confirmation Procedure**

NAEC0441

CAUTION:

Always drive vehicle at a safe speed.

#### NOTE:

 "COMPLETED" will appear on CONSULT screen when all tests "COND1", "COND2" and "COND3" are completed.

• If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

#### **TESTING CONDITION:**

Never stop engine during this test. If the engine is stopped, reperform this test from step 2 in "Procedure for COND 1".

#### Procedure for COND1

- 1) Start engine and warm it up to normal operating temperature.
- 2) Turn ignition switch "OFF" and wait at least 5 seconds.
- 3) Turn ignition switch "ON" and select "RR O2 SEN-B1 (-B2) P0138 (P0158)" of "RR O2 SENSOR" in "DTC WORK SUP-PORT" mode with CONSULT.
- 4) Touch "START".
- 5) Start engine and let it idle for at least 30 seconds.
- 6) Rev engine up to 2,000 rpm 2 or 3 times quickly under no load. If "COMPLETED" appears on CONSULT screen, go to step 2 in "Procedure for COND3".

If "COMPLETED" does not appear on CONSULT screen, go to the following step.

- Orive vehicle at a speed of more than 70 km/h (43 MPH) for 2 consecutive minutes.
- B) When the following conditions are met, "TESTING" will be displayed at "COND1" on the CONSULT screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take approximately 60 seconds.)

CMPS-RPM (POS)	1,300 - 3,100 rpm (A/T) 1,500 - 3,600 rpm (M/T)
Vehicle speed	64 - 130 km/h (40 - 80 MPH)
B/FUEL SCHDL	0.5 - 6.4 msec (A/T) 0.5 - 5.9 msec (M/T)
Selector lever	Suitable position

#### NOTE:

- If "TESTING" is not displayed after 5 minutes, retry from step 2 in "Procedure for COND1".
- If "COMPLETED" already appears at "COND2" on CON-SULT screen before "Procedure for COND2" is conducted, it is unnecessary to conduct "Procedure for COND2".

The rear heated oxygen sensor has a much longer switching time between rich and lean than the front heated oxygen sensor. The oxygen storage capacity before the three way catalyst causes the longer switching time. To judge the malfunctions of rear heated oxygen sensor, ECM monitors whether the voltage is unusually high during the various driving condition such as fuel-cut.

DTC No.	Malfunction is detected when	Check Items (Possible Cause)	HA

DTC Confirmation Procedure

### **DTC Confirmation Procedure**

**CAUTION:** 

Always drive vehicle at a safe speed.

#### NOTE:

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

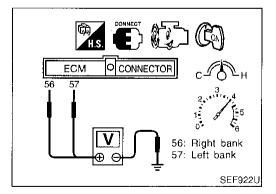

NAEC0459

### (I) With CONSULT

- Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
- 2) Start engine and drive vehicle at a speed of more than 70 km/h (43 MPH) for 2 consecutive minutes.
- 3) Stop vehicle with engine running.
- 4) Let engine idle for 1 minute.
- Maintain the following conditions for at least 5 consecutive seconds.

CMPS-RPM (REF)	1,300 - 3,100 rpm (A/T) 1,500 - 3,600 rpm (M/T)
VHCL SPEED SE	64 - 130 km/h (40 - 80 MPH)
B/FUEL SCHDL	0.5 - 6.4 msec (A/T) 0.5 - 5.9 msec (M/T)
COOLAN TEMP/S	70 - 100°C (158 - 212°F)
Selector lever	Suitable position

6) If 1st trip DTC is detected, go to "Diagnostic Procedure".

### **Overall Function Check**

Use this procedure to check the overall function of the rear heated oxygen sensor circuit. During this check, a 1st trip DTC might not be confirmed.

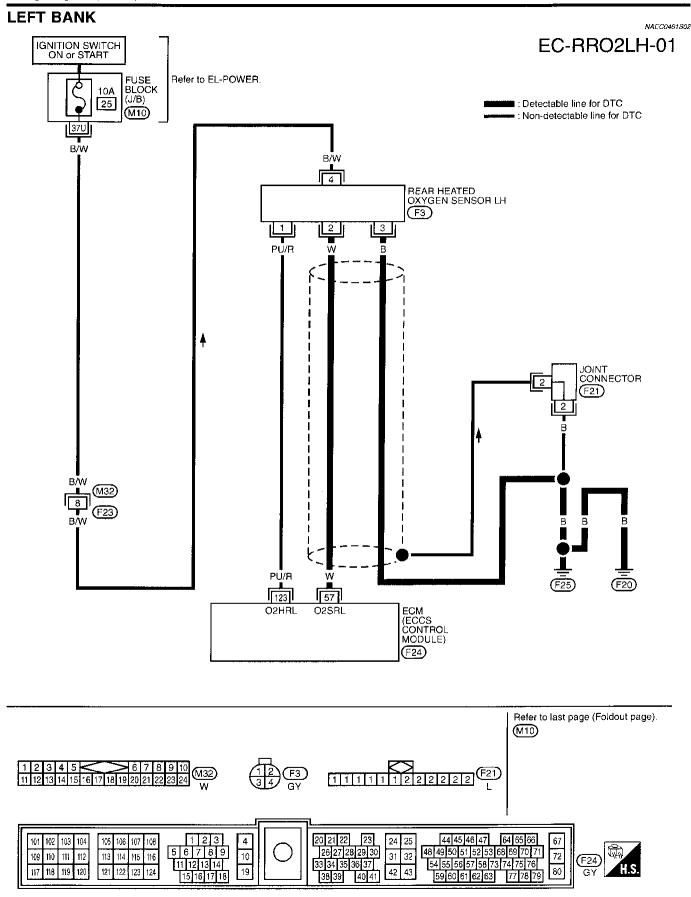

#### (R) Without CONSULT

- 1) Start engine and drive vehicle at a speed of more than 70 km/h (43 MPH) for 2 consecutive minutes.
- Stop vehicle with engine running.
- Set voltmeter probes between ECM terminal 56 (right bank sensor signal) or 57 (left bank sensor signal) and engine ground.
- 4) Check the voltage when racing up to 4,000 rpm under no load at least 10 times.
  - (depress and release accelerator pedal as soon as possible)

    The voltage should be below 2V during this procedure.
- 5) If NG, go to "Diagnostic Procedure".

# Component Inspection REAR HEATED OXYGEN SENSOR

NAEC0463

NAEC0463S01

1) Start engine and drive vehicle at a speed of more than 70 km/h (43 MPH) for 2 consecutive minutes.

Stop vehicle with engine running.

 Select "FUEL INJECTION" in "ACTIVE TEST" mode, and select "RR O2 SEN-B1 (-B2)" as the monitor item with CON-SULT.

4) Check "RR O2 SEN-B1 (-B2)" at idle speed when adjusting "FUEL INJECTION" to ±25%.

"RR O2 SEN-B1 (-B2)" should be above 0.56V at least once when the "FUEL INJECTION" is +25%.

"RR O2 SEN-B1 (-B2)" should be below 0.54V at least once when the "FUEL INJECTION" is -25%.

**♥** Without CONSULT

(A) With CONSULT

Start engine and drive vehicle at a speed of more than 70 km/h
 MPH) for 2 consecutive minutes.

Stop vehicle with engine running.

 Set voltmeter probes between ECM terminal 56 (right bank sensor signal) or 57 (left bank sensor signal) and engine ground.

 Check the voltage when racing up to 4,000 rpm under no load at least 10 times.

(depress and release accelerator pedal as soon as possible)

The voltage should be above 0.56V at least once during this procedure.

If the voltage is above 0.56V at step 4, step 5 is not necessary.

Keep vehicle at idling for 10 minutes, then check the voltage. Or check the voltage when coasting from 80 km/h (50 MPH) in 3rd gear position (M/T), "D" position with "OD" OFF (A/T). The voltage should be below 0.54V at least once during this procedure.

DTC Confirmation Procedure

### **DTC Confirmation Procedure**

NAFC0116

#### NOTE:

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

#### **TESTING CONDITION:**

Before performing the following procedure, confirm that battery voltage is between 10.5V and 16V at idle.

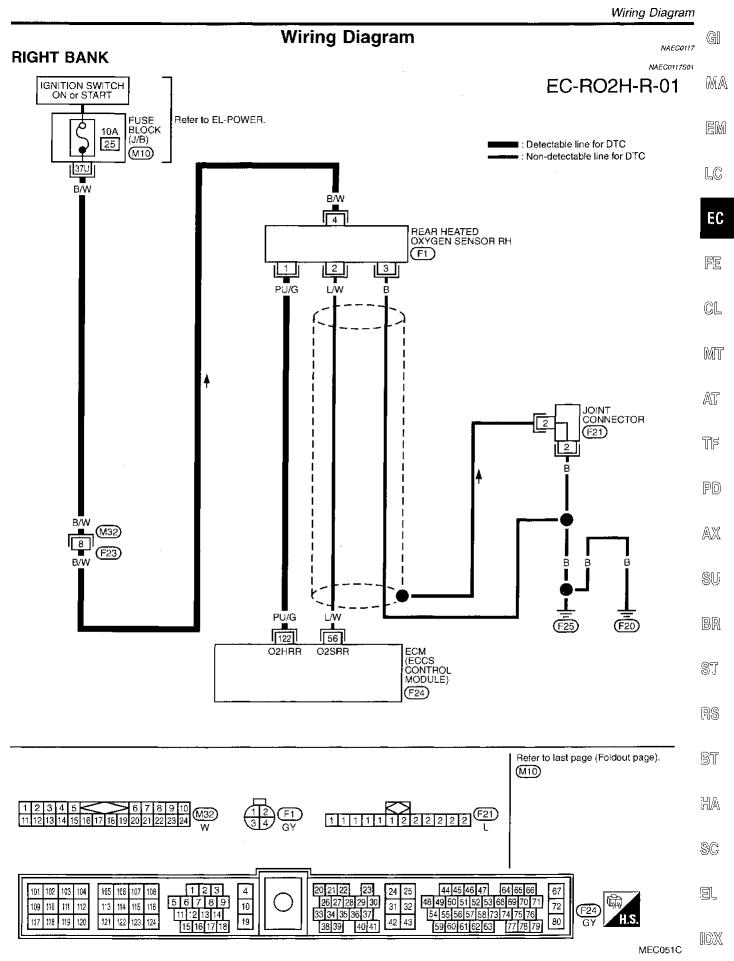

- (中) With CONSULT
- Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
- Start engine.
- 3) Drive vehicle at a speed of more than 70 km/h (43 MPH) for 2 consecutive minutes.
- 4) Stop vehicle and let engine idle for at least 6 seconds.
- 5) If 1st trip DTC is detected, go to "Diagnostic Procedure".

### With GST Output 
- 1) Start engine.
- 2) Drive vehicle at a speed of more than 70 km/h (43 MPH) for 2 consecutive minutes.
- 3) Stop vehicle and let engine idle for at least 6 seconds.
- 4) Turn ignition switch "OFF" and wait at least 5 seconds.
- Start engine.
- 6) Drive vehicle at a speed of more than 70 km/h (43 MPH) for 2 consecutive minutes.
- 7) Stop vehicle and let engine idle for at least 6 seconds.
- 8) Select "MODE 3" with GST.
- 9) If DTC is detected, go to "Diagnostic Procedure".

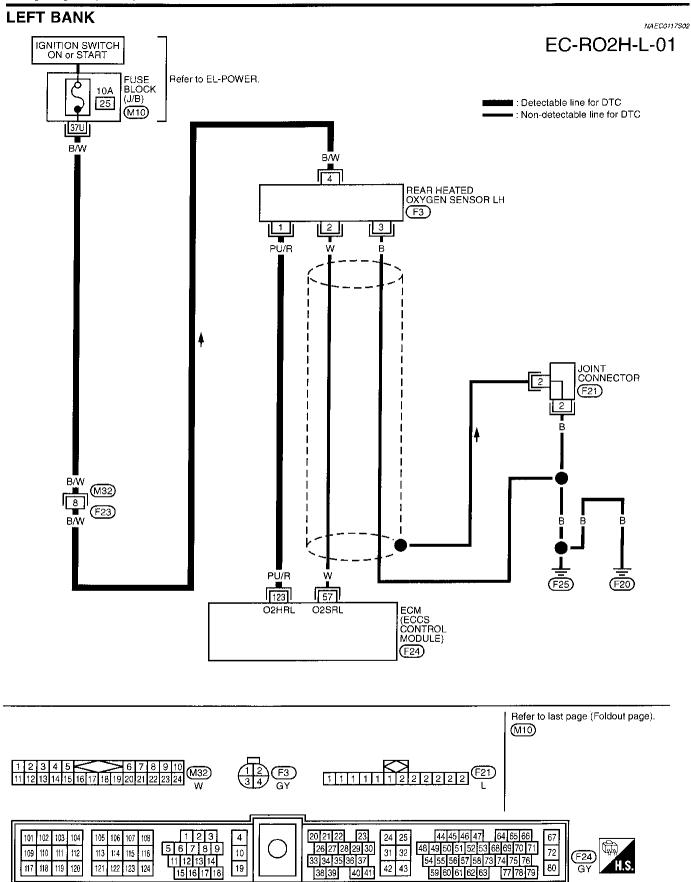

### No Tools

- 1) Start engine.
- 2) Drive vehicle at a speed of more than 70 km/h (43 MPH) for 2 consecutive minutes.
- 3) Stop vehicle and let engine idle for at least 6 seconds.
- 4) Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
- Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.
- 6) If 1st trip DTC is detected, go to "Diagnostic Procedure".
- When using GST, "DTC Confirmation Procedure" should be performed twice as much as when using CONSULT or ECM (Diagnostic Test Mode II) because GST cannot display MODE 7 (1st trip DTC) concerning this diagnosis. Therefore, using CONSULT or ECM (Diagnostic Test Mode II) is recommended.

On Board Diagnosis Logic

### On Board Diagnosis Logic

With the Air/Fuel Mixture Ratio Self-Learning Control, the actual mixture ratio can be brought closely to the theoretical mixture ratio based on the mixture ratio feedback signal from the front heated oxygen sensors. The ECM calculates the necessary compensation to correct the offset between the actual and the theoretical ratios. In case the amount of the compensation value is extremely large (The actual mixture ratio is too lean.), the ECM judges the condition as the fuel injection system malfunction and light up the MIL (2 trip detection logic).

Sensor	Input Signal to ECM	ECM func- tion	Actuator
Front heated oxygen sensors	Density of oxygen in exhaust gas (Mixture ratio feedback signal)	Fuel injec- tion control	Injectors

DTC No.	Malfunction is detected when	Check Items (Possible Cause)

# **DTC Confirmation Procedure**

NOTE:

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

(P) With CONSULT

Start engine and warm it up to normal operating temperature.

Turn ignition switch "OFF" and wait at least 5 seconds.

3) Turn ignition switch "ON" and select "SELF-LEARN CON-TROL" in "ACTIVE TEST" mode with CONSULT.

Clear the self-learning control coefficient by touching "CLEAR".

Select "DATA MONITOR" mode with CONSULT.

Start engine again and let it idle for at least 10 minutes. The 1st trip DTC P0171 or P0174 should be detected at this stage, if a malfunction exists. If so, go to "Diagnostic Procedure", EC-253.

If it is difficult to start engine at step 6, the fuel injection system has a malfunction, too.

Crank engine while depressing accelerator pedal. If engine starts, go to "Diagnostic Procedure", EC-253. If engine does not start, check exhaust and intake air leak visually.

### With GST

- Start engine and warm it up to normal operating temperature. 1)
- 2) Turn ignition switch "OFF" and wait at least 5 seconds.
- Disconnect mass air flow sensor harness connector. Then 3) restart and run engine for at least 5 seconds at idle speed.
- 4) Stop engine and reconnect mass air flow sensor harness connector.
- Select "MODE 7" with GST. Make sure 1st trip DTC P0100 is detected.

Select "MODE 4" with GST and erase the 1st trip DTC P0100.

7) Start engine again and let it idle for at least 10 minutes.

### **DTC Confirmation Procedure**

NAEC0155

#### NOTE:

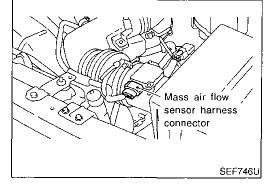

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

### (P) With CONSULT

- 1) Start engine and warm it up to normal operating temperature.
- Turn ignition switch "OFF" and wait at least 5 seconds.
- Turn ignition switch "ON" and select "SELF-LEARN CON-TROL" in "ACTIVE TEST" mode with CONSULT.
- 4) Clear the self-learning control coefficient by touching "CLEAR".
- 5) Select "DATA MONITOR" mode with CONSULT.
- 6) Start engine again and let it idle for at least 10 minutes. The 1st trip DTC P0172, P0175 should be detected at this stage, if a malfunction exists. If so, go to "Diagnostic Procedure", EC-260.
- 7) If it is difficult to start engine at step 6, the fuel injection system has a malfunction, too.
- Crank engine while depressing accelerator pedal.
   If engine starts, go to "Diagnostic Procedure", EC-260. If engine does not start, remove ignition plugs and check for fouling, etc.

### With GST

- 1) Start engine and warm it up to normal operating temperature.
- 2) Turn ignition switch "OFF" and wait at least 5 seconds.
- 3) Disconnect mass air flow sensor harness connector. Then restart and run engine for at least 5 seconds at idle speed.
- 4) Stop engine and reconnect mass air flow sensor harness connector.
- 5) Select "MODE 7" with GST. Make sure 1st trip DTC P0100 is detected.
- Select "MODE 4" with GST and erase the 1st trip DTC P0100.
- 7) Start engine again and let it idle for at least 10 minutes.

DTC Confirmation Procedure (Cont'd)

 Select "MODE 7" with GST. The 1st trip DTC P0172 or P0175 should be detected at this stage, if a malfunction exists. If so, go to "Diagnostic Procedure", EC-260.

10) Crank engine while depressing accelerator pedal. If engine starts, go to "Diagnostic Procedure", EC-260. If engine does not start, check exhaust and intake air leak visually.

### R Without CONSULT

- 1) Disconnect mass air flow sensor harness connector.
- 2) Start engine and run it for at least 5 seconds at idle speed.
- 3) Stop engine and reconnect mass air flow sensor harness connector.
- Turn ignition switch "ON".
- 5) Perform Diagnostic Test Mode II (Self-diagnostic results) with ECM. Make sure 1st trip DTC 0102 is detected.
- 6) Erase the 1st trip DTC 0102 by changing from Diagnostic Test Mode II to Diagnostic Test Mode I. Refer to "HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION", EC-55.
- Perform Diagnostic Test Mode II (Self-diagnostic results) with ECM. Make sure DTC 0505 is detected.
- 8) Start engine again and let it idle for at least 10 minutes. The 1st trip DTC 0114 or 0209 should be detected at this stage, if a malfunction exists. If so, go to "Diagnostic Procedure", EC-260.
- If it is difficult to start engine at step 8, the fuel injection system also has a malfunction.
- Crank engine while depressing accelerator pedal.
   If engine starts, go to "Diagnostic Procedure", EC-260. If engine does not start, remove ignition plugs and check for fouling, etc.

### DTC P0180 TANK FUEL TEMPERATURE SENSOR

Component Description

### **Component Description**

The tank fuel temperature sensor is used to detect the fuel temperature inside the fuel tank. The sensor modifies a voltage signal from the ECM. The modified signal returns to the ECM as the fuel temperature input. The sensor uses a thermistor which is sensitive to the change in temperature. The electrical resistance of the thermistor decreases as temperature increases.

If NG, replace tank fuel temperature sensor.

### DTC P0300 - P0306 NO. 6 - 1 CYLINDER MISFIRE, MULTIPLE CYLINDER MISFIRE

On Board Diagnosis Logic

### On Board Diagnosis Logic

(Gi

If a misfire occurs, the engine speed will fluctuate. If the fluctuation is detected by the crankshaft position sensor (OBD), the misfire is diagnosed.

sor (OBD), the mistire is diagnosed.			
Sensor	Input Signal to ECM	ECM function	MA
Crankshaft position sensor (OBD)	Engine speed	On board diagnosis of misfire	EM

The misfire detection logic consists of the following two conditions.

One Trip Detection Logic (Three Way Catalyst Damage)

LC

When a misfire is detected which will overheat and damage the three way catalyst, the malfunction indicator lamp (MIL) will start blinking; even during the first trip. In this condition, ECM monitors the misfire every 200 revolutions.

EC

If the misfire frequency decreases to a level that will not damage the three way catalyst, the MIL will change from blinking to lighting up.

(After the first trip detection, the MIL will light up from engine starting. If a misfire is detected that will cause three way catalyst damage, the MIL will start blinking.)

2. Two Trip Detection Logic (Exhaust quality deterioration) When a misfire that will not damage the three way catalyst (but will affect exhaust emission) occurs, the malfunction indicator lamp will light up based on two trip detection logic. In this condition, ECM monitors the misfire for every 1,000 revolutions of the engine.

### Component Description

NAFC0176 The knock sensor is attached to the cylinder block. It senses engine knocking using a piezoelectric element. A knocking vibration from the cylinder block is sensed as vibrational pressure. This pressure is converted into a voltage signal and sent to the ECM. Freeze frame data will not be stored in the ECM for the knock

sensor. The MIL will not light for knock sensor malfunction.

The knock sensor has one trip detection logic.

### **ECM Terminals and Reference Value**

Resistance: 500 - 620 k $\Omega$  [at 25°C (77°F)]

### **CAUTION:**

Do not use any knock sensors that have been dropped or physically damaged. Use only new ones.

Component Description

### **Component Description**

The crankshaft position sensor (OBD) is located on the transaxle housing facing the gear teeth (cogs) of the flywheel or drive plate. It detects the fluctuation of the engine revolution.

The sensor consists of a permanent magnet, core and coil.

When the engine is running, the high and low parts of the teeth cause the gap with the sensor to change.

The changing gap causes the magnetic field near the sensor to change.

Due to the changing magnetic field, the voltage from the sensor changes.

The ECM receives the voltage signal and detects the fluctuation of the engine revolution.

This sensor is not used to control the engine system. It is used only for the on board diagnosis.

### DTC P0340 CAMSHAFT POSITION SENSOR (CMPS)

Component Description

### **Component Description**

The camshaft position sensor is a basic component of the engine control system. It monitors engine speed and piston position. These input signals to the ECM are used to control fuel injection, ignition timing and other functions.

The camshaft position sensor has a rotor plate and a wave-forming circuit. The rotor plate has 360 slits for a 1° (POS) signal and 6 slits for a 120° (REF) signal. The wave-forming circuit consists of Light Emitting Diodes (LED) and photo diodes.

The rotor plate is positioned between the LED and the photo diode. The LED transmits light to the photo diode. As the rotor plate turns, the slits cut the light to generate rough-shaped pulses. These pulses are converted into on-off signals by the wave-forming circuit and sent to the ECM.

The distributor is not repairable and must be replaced as an assembly except distributor cap and rotor head.

#### NOTE:

The rotor screw which secures the distributor rotor to the distributor shaft must be torqued properly.

 If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

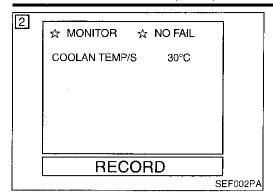

### **TESTING CONDITION:**

Before performing the following procedure, confirm that battery voltage is more than 10.5V at idle.

469

DTC Confirmation Procedure (Cont'd)

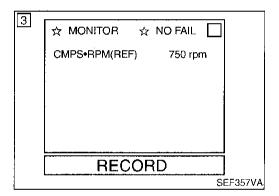

### PROCEDURE FOR MALFUNCTION A

NAEC0193S01

- (I) With CONSULT
- 1) Turn ignition switch "ON".
- Select "DATA MONITOR" mode with CONSULT.
- Crank engine for at least 2 seconds.
- 4) If 1st trip DTC is detected, go to "Diagnostic Procedure", EC-286.
- With GST
- 1) Crank engine for at least 2 seconds.
- 2) Select "MODE 7" with GST.
- If 1st trip DTC is detected, go to "Diagnostic Procedure", EC-286.

### No Tools

- 1) Crank engine for at least 2 seconds.
- Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
- 3) Perform "Diagnostic Test Mode II" (Self-diagnostic results) with ECM.
- 4) If 1st trip DTC is detected, go to "Diagnostic Procedure", EC-286.

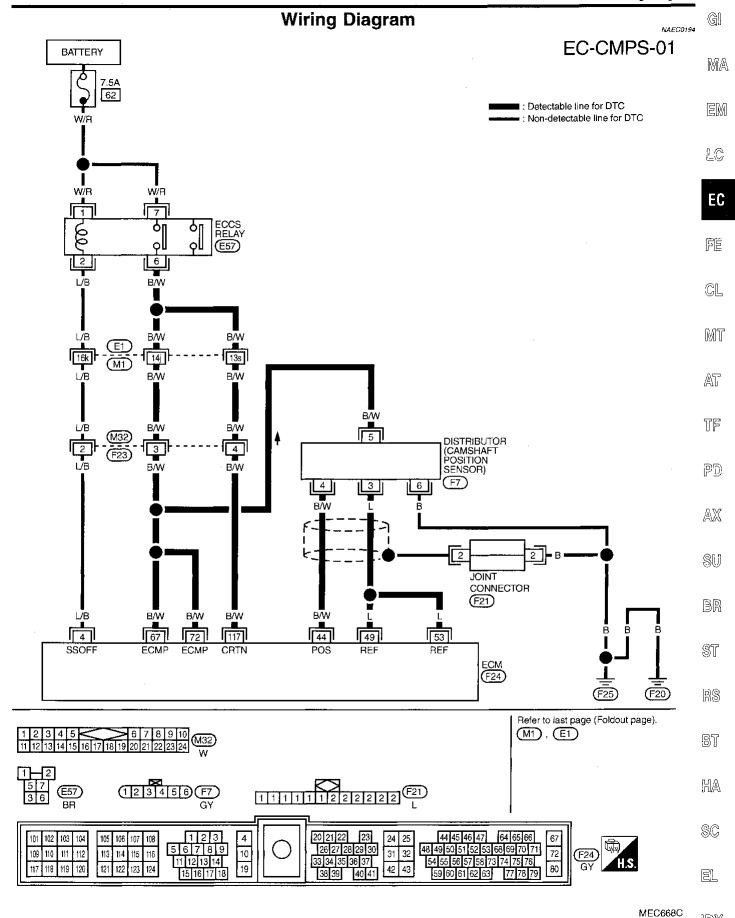

### PROCEDURE FOR MALFUNCTION B AND C

NAEC0193S02

- (P) With CONSULT
- 1) Turn ignition switch "ON".
- Select "DATA MONITOR" mode with CONSULT.
- 3) Start engine and run it for at least 2 seconds at idle speed.
- If 1st trip DTC is detected, go to "Diagnostic Procedure", EC-286.
- With GST
- 1) Start engine and run it for at least 2 seconds at idle speed.
- 2) Select "MODE 7" with GST.
- 3) If 1st trip DTC is detected, go to "Diagnostic Procedure", EC-286.
- No Tools
- 1) Start engine and run it for at least 2 seconds at idle speed.
- Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".
- Perform "Diagnostic Test Mode II" (Self-diagnostic results) with ECM.
- 4) If 1st trip DTC is detected, go to "Diagnostic Procedure", EC-286.

Sensor	Input Signal to ECM	ECM func- tion	Actuator	
Camshaft position sensor	Engine speed			
Mass air flow sensor	Amount of intake air			
Engine coolant temperature sensor	Engine coolant temperature	EGR con-	EGRC-solenoid valve	
Ignition switch	Start signal			
Throttle position sensor	Throttle position			

EC

LC

MA

This system cuts and controls vacuum applied to the EGR valve to suit engine operating conditions. This cut-and-control operation is accomplished through the ECM and the EGRC-solenoid valve. When the ECM detects any of the following conditions, current does not flow through the solenoid valve. This causes the intake manifold vacuum to be discharged into the atmosphere. The EGR valve remains closed.

Low engine coolant temperature

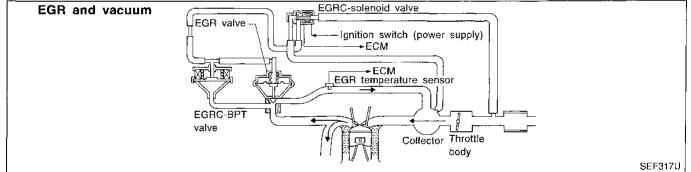

MI

- Engine starting
  - High-speed engine operation

AT

### COMPONENT DESCRIPTION **Exhaust Gas Recirculation (EGR) Valve**

The EGR valve controls the amount of exhaust gas routed to the intake manifold. Vacuum is applied to the EGR valve in response to throttle valve opening and EGRC-BPT valve operation. The vacuum controls the movement of a taper valve connected to the vacuum diaphragm in the EGR valve.

### **DTC P0400 EGR FUNCTION (CLOSE)**

#### Description (Cont'd)

### **EGRC-solenoid Valve**

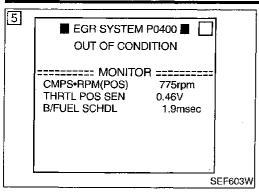

The EGRC-solenoid valve responds to signals from the ECM. When the ECM sends an ON (ground) signal, the coil in the solenoid valve is energized. The vacuum signal (from the intake manifold collector to the EGR valve) passes through the solenoid valve. The signal then reaches the EGR valve.

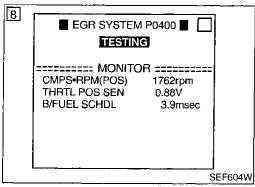

When the ECM sends an OFF signal, a plunger will then move to cut the vacuum signal.

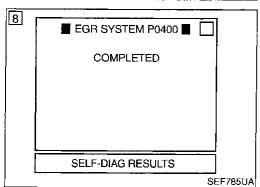

On Board Diagnosis Logic

If the absence of EGR flow is detected by EGR temperature sensor under the condition that calls for EGR, a low-flow malfunction is diagnosed.

DTC No.	Malfunction is detected when	Check Items (Possible Cause)
P0400 0302	No EGR flow is detected under condition that calls for EGR.	<ul> <li>EGR valve stuck closed</li> <li>EGRC-BPT valve</li> <li>Vacuum hoses</li> <li>EGRC-solenoid valve</li> <li>EGR passage</li> <li>EGR temperature sensor</li> <li>Exhaust gas leaks</li> </ul>

### DTC Confirmation Procedure

CAUTION:

Always drive vehicle at a safe speed.

#### NOTE:

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

 P0400 will not be displayed at "SELF-DIAG RESULTS" mode with CONSULT even though DTC work support test result is NG.

#### **TESTING CONDITION:**

For best results, perform the test at a temperature of 5°C (41°F) or higher.

With CONSULT

1) Turn ignition switch "ON".

Check "COOLAN TEMP/S" in "DATA MONITOR" mode with CONSULT.

Confirm COOLAN TEMP/S value is within the range listed below.

### COOLAN TEMP/S: Less than 40°C (104°F)

If the value is out of range, park the vehicle in a cool place and allow the engine temperature to stabilize. Do not attempt to lower the engine coolant temperature with a fan or means other than ambient air. Doing so may produce an inaccurate diagnostic result.

3) Start engine and let it idle monitoring "COOLAN TEMP/S" value. When the "COOLAN TEMP/S" value reaches 70°C (158°F), immediately go to the next step.

 Select "EGR SYSTEM P0400" of "EGR SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT.

Touch "START".

6) Accelerate vehicle to a speed of 40 km/h (25 MPH) once and then stop vehicle with engine running. If "COMPLETED" appears on CONSULT screen, go to step 9. If "COMPLETED" does not appear on CONSULT screen, go to the following step.

7) Check the output voltage of "THRTL POS SEN" (at closed throttle position) and note it.

8) When the following conditions are met, "TESTING" will be displayed on the CONSULT screen. Maintain the conditions until "TESTING" changes to "COMPLETED". (It will take approximately 60 seconds or more.)

	,,		
CMPS-RPM (POS)	1,600 - 2,400 rpm (A/T) 1,800 - 2,600 rpm (M/T)		
B/FUEL SCHDL	3.0 - 4.5 msec		
THRTL POS SEN	X - (X + 0.7) V (A/T) X - (X + 0.66) V (M/T) X = Voltage value measured at step 7		
Selector lever	Suitable position	<del></del>	

If "TESTING" is not displayed after 5 minutes, retry from step 2.

 Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to "Diagnostic Procedure", EC-294. GI

### **DTC P0400 EGR FUNCTION (CLOSE)**

#### Overall Function Check

### **Overall Function Check**

Use this procedure to check the overall EGR function. During this check, a 1st trip DTC might not be confirmed.

Mithout CONSULT

- 1) Start engine and warm it up to normal operating temperature.
- Check the EGR valve lifting when revving engine from idle up to 3,000 rpm quickly under no load.

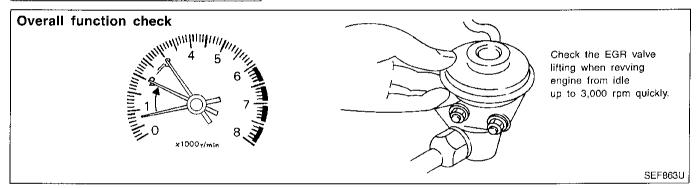

**EGR** valve should lift up and down without sticking. If NG, go to "Diagnostic Procedure", EC-294.

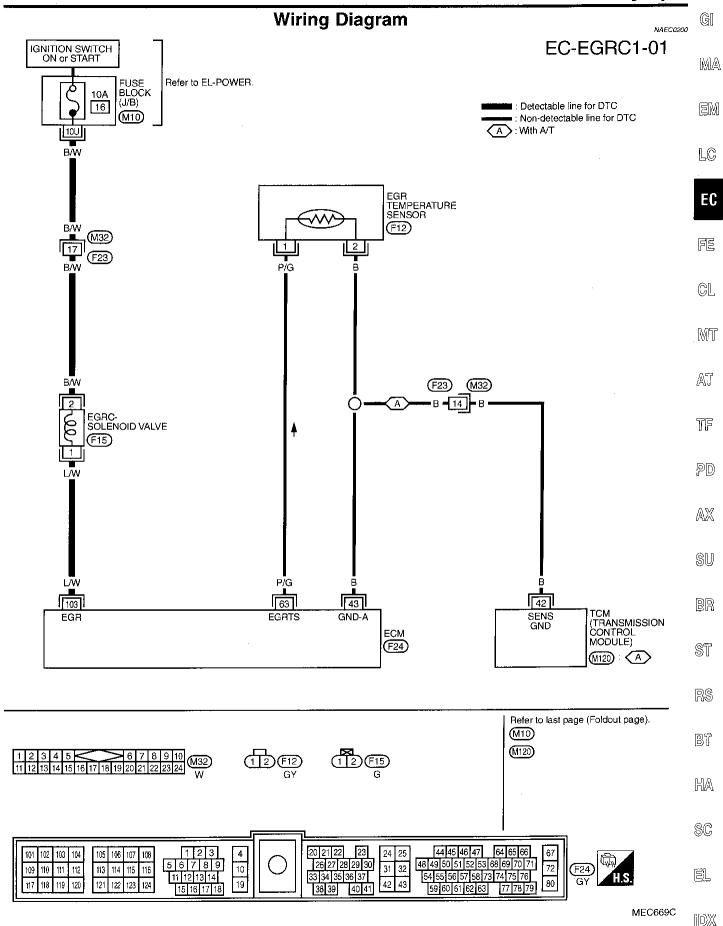

3) Check voltage between ECM terminal 63 (EGR temperature sensor signal) and ground at idle speed.

Less than 4.5V should exist.

If NG, go to the next step.

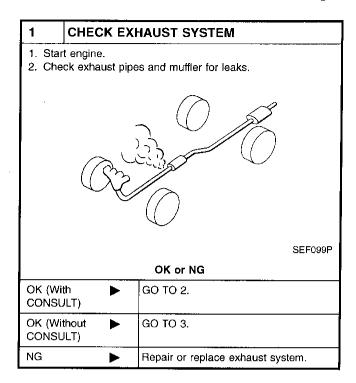

- 4) Turn ignition switch "OFF".
- 5) Disconnect EGR temperature sensor harness connector.
- 6) Check harness continuity between EGR temperature sensor harness connector terminal 2 and ground.
   Continuity should exist.
- 7) Perform "EGR TEMPERATURE SENSOR", "Component Inspection", EC-388.

### Component Inspection EGR VALVE

NAEC0202

MECOGOGEOS

Apply vacuum to EGR vacuum port with a hand vacuum pump. EGR valve spring should lift.

Check for sticking.

If NG, repair or replace EGR valve.

### EGRC-BPT VALVE

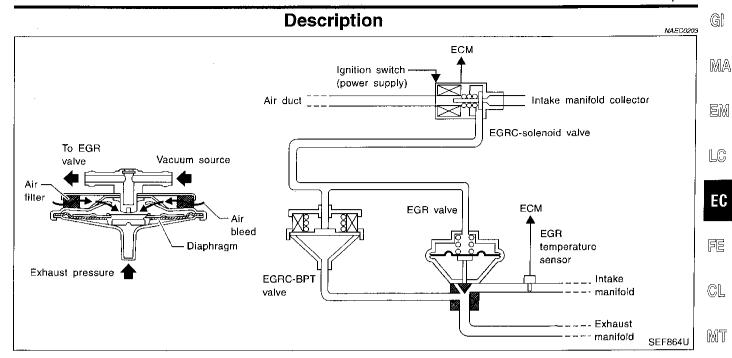

NAEC0202S04

Plug one of two ports of EGRC-BPT valve.

- Vacuum from the other port and check for leakage while applying a pressure above 0.981 kPa (100 mmH<sub>2</sub>O, 3.94 inH<sub>2</sub>O) from under EGRC-BPT valve.
- 3. If a leakage is noted, replace the valve.

### DTC P0402 EGRC-BPT VALVE FUNCTION

Description

### SYSTEM DESCRIPTION

The EGRC-BPT valve monitors exhaust pressure to activate the diaphragm, controlling intake manifold vacuum applied to the EGR valve. In other words, recirculated exhaust gas is controlled in response to positioning of the EGR valve or to engine operation.

On Board Diagnosis Logic

If too much EGR flow exists due to an EGRC-BPT valve malfunction, off idle engine roughness will increase. If the roughness is large, then the vacuum to the EGR valve is interrupted through the EGRC-solenoid valve. If the engine roughness is reduced at that time, the EGRC-BPT valve malfunction is indicated.

DTC No.	Malfunction is detected when	Check Items (Possible Cause)

### DTC Confirmation Procedure CAUTION:

Always drive vehicle at a safe speed.

#### NOTE:

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

NAEC0465

#### **TESTING CONDITION**

For best results, perform the test at a temperature of 5°C (41°F) or higher.

- (A) With CONSULT
- 1) Install vacuum gauge between EGRC-BPT valve and EGR valve as shown in the illustration.
- 2) Start engine and warm it up to normal operating temperature.
- 3) Stop engine and wait at least 5 seconds.
- Turn ignition switch "ON" and select "EGRC-BPT/V P0402" of "EGR SYSTEM" in "DTC WORK SUPPORT" mode with CON-SULT.
- 5) Start engine and let it idle.
- 6) Touch "START".
- 7) Check the output voltage of "THRTL POS SEN" (at closed throttle position) and note it.
- 8) When the following conditions are met, "TESTING" will be displayed on the CONSULT screen and the bar chart may increase. Maintain the conditions many times until "COMPLETED" appears.

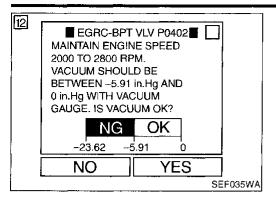

CMPS RPM (POS)	1,200 - 1,800 rpm (A/T) 1,400 - 2,200 rpm (M/T)
Vehicle speed	30 - 60 km/h (19 - 37 MPH) (A/T) 30 - 100 km/h (19 - 62 MPH) (M/T)
B/FUEL SCHDL	2.3 - 2.8 msec (A/T) 2.3 - 2.7 msec (M/T)
THRTL POS SEN	X - (X + 0.88) V X = Voltage value measured at step 7
Selector lever	Suitable position

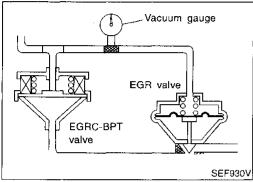

- The bar chart on CONSULT screen indicates the status of this test. However, the test may be finished before the bar chart becomes full scale.
- If the bar chart indication does not continue to progress, completely release accelerator pedal once and try to meet the conditions again.
- If "TESTING" does not appear on CONSULT screen, retry from step 3.
- If CONSULT instructs to carry out "OVERALL FUNCTION CHECK", go to next step. If "NG" is displayed, refer to "Diagnostic Procedure", EC-299.
- 10) Open engine hood.
- 11) Raise engine speed to 2,000 to 2,800 rpm under no-load and hold it. Then touch "NEXT" on CONSULT screen.

484

### DTC P0402 EGRC-BPT VALVE FUNCTION

DTC Confirmation Procedure (Cont'd)

12) Check vacuum gauge while keeping engine speed 2,000 to 2.800 rpm.

Vacuum should be 0 to -20 kPa (0 to -150 mmHg, 0 to -5.91 inHa).

If NG, go to "Diagnostic Procedure", EC-299.

If OK, touch "YES" on the CONSULT screen.

13) Check the rubber tube between intake manifold collector. EGRC-solenoid valve, EGR valve and EGRC-BPT valve for cracks, blockages or twist.

If NG, repair or replace.

If OK, touch "YES" on the CONSULT screen.

### Overall Function Check

Use this procedure to check the overall function of the EGRC-BPT valve. During this check, a 1st trip DTC might not be confirmed. (R) Without CONSULT

- Install vacuum gauge between EGRC-BPT valve and EGR valve as shown in the illustration.
- 2) Lift up vehicle.
- Start engine and shift to "1st" gear or "1" position.
- Check vacuum gauge while keeping engine speed 2,000 to 2,800 rpm.

Vacuum should be 0 to -20 kPa (0 to -150 mmHg, 0 to -5.91 inHa).

If NG, go to "Diagnostic Procedure", EC-299.

If OK, go to next step.

5) Check rubber tube between intake manifold collector, EGRCsolenoid valve, EGR valve and EGRC-BPT valve for misconnections, cracks or blockages. If NG, repair or replace.

### Diagnostic Procedure

1	СНЕСК НО	OSE
Turn ignition switch "OFF".     Check vacuum hose for clogging and improper connection.     OK or NG

### Component Inspection EGRC-BPT VALVE

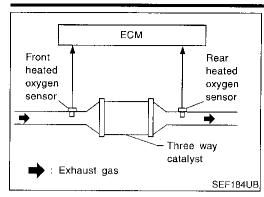

NAEC0206

NAEC0206S01

- 1. Plug one of two ports of EGRC-BPT valve.
- Vacuum from the other port and check leakage without applying any pressure from under EGR-BPT valve. Leakage should exist.

### DTC P0420 (RIGHT BANK, -B1), P0430 (LEFT BANK, -B2) THREE WAY CATALYST FUNCTION

On Board Diagnosis Logic

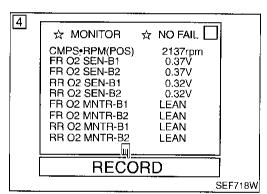

### On Board Diagnosis Logic

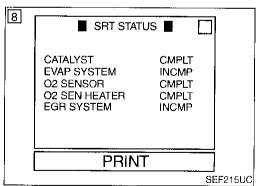

The ECM monitors the switching frequency ratio of front and rear heated oxygen sensors.

A warm-up three way catalyst with high oxygen storage capacity will indicate a low switching frequency of rear heated oxygen sensor. As oxygen storage capacity decreases, the rear heated oxygen sensor switching frequency will increase.

When the frequency ratio of front and rear heated oxygen sensors approaches a specified limit value, the warm-up three way catalyst malfunction is diagnosed.

			<b>3</b> 34

### **DTC Confirmation Procedure**

#### **CAUTION:**

Always drive vehicle at a safe speed.

#### NOTE:

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

#### (P) With CONSULT

- Start engine and drive vehicle at a speed of more than 70 km/h (43 MPH) for 2 consecutive minutes.
- 2) Stop vehicle with engine running.
- Set "MANU TRIG" and "HI SPEED", then select "FR O2 SEN-B1 (-B2)", "RR O2 SEN-B1 (-B2)", "FR O2 MNTR-B1 (-B2)", "RR O2 MNTR-B1 (-B2)" in "DATA MONITOR" mode with CONSULT.
- Touch "RECORD" on CONSULT screen with engine speed held at 2,000 rpm constantly under no load.
- Make sure that the switching frequency between "RICH" and "LEAN" of "RR O2 MNTR-B1 (-B2)" is much less than that of "FR O2 MNTR-B1 (-B2)" as shown below.

#### Switching frequency ratio = A/B

A: Rear heated oxygen sensor switching frequency B: Front heated oxygen sensor switching frequency This ratio should be less than 0.75.

If the ratio is greater than above, the warm-up three way catalyst is not operating properly.

If the "FR O2 MNTR-B1 (-B2)" does not indicate "RICH" and "LEAN" periodically more than 5 times within 10 seconds at step 4, perform trouble diagnosis for "DTC P0133, P0153" first. (See EC-187.)

If the result is NG, go to "Diagnostic Procedure", EC-302. If the result is OK, go to following step.

Select "AUTO TRIG" in "DATA MONITOR" mode with CON-SULT.

### DTC P0420 (RIGHT BANK, -B1), P0430 (LEFT BANK, -B2) THREE WAY CATALYST FUNCTION

DTC Confirmation Procedure (Cont'd)

- Drive vehicle at a speed of approximately 86 to 96 km/h (53 to 60 MPH) with "D" position ("OD" ON) (A/T), 5th gear position (M/T) for at least 10 consecutive minutes. (Drive the vehicle in an area where vehicle speed and accelerator pressure can be held steady and constant.) If the result is NG, go to "Diagnostic Procedure".
- Select "SRT STATUS" in "DTC CONFIRMATION" mode with CONSULT.
- Verify that "CATALYST" is "CMPLT". 9) If not "CMPLT", repeat the test from step 6.

### Overall Function Check

Use this procedure to check the overall function of the warm-up three way catalyst. During this check, a 1st trip DTC might not be confirmed.

### Without CONSULT

- Start engine and drive vehicle at a speed of more than 70 km/h (43 MPH) for 2 consecutive minutes.
- 2) Stop vehicle with engine running.
- Set voltmeters probes between ECM terminals 50 (front heated oxygen sensor right bank signal), 51 (front heated oxygen sensor left bank signal) and engine ground, and ECM terminals 56 (rear heated oxygen sensor right bank signal), 57 (rear heated oxygen sensor left bank signal) and engine ground.
- 4) Keep engine speed at 2,000 rpm constant under no load.
- 5) Make sure that the voltage switching frequency (high & low) between ECM terminals 56 and engine ground, or 57 and engine ground is very less than that of ECM terminals 50 and engine ground, or 51 and engine ground.

Switching frequency ratio = A/B

A: Rear heated oxygen sensor voltage switching fre-

B: Front heated oxygen sensor voltage switching frequency

This ratio should be less than 0.75.

If the ratio is greater than above, it means warm-up three way catalyst does not operate properly. Go to "Diagnostic Procedure", EC-302.

If the voltage at terminal 50 or 51 does not switch periodically more than 5 times within 10 seconds at step 5, perform trouble diagnosis for "DTC P0133, P0153" first. (See EC-187.)

On Board Diagnosis Logic

### On Board Diagnosis Logic

NAEC0210

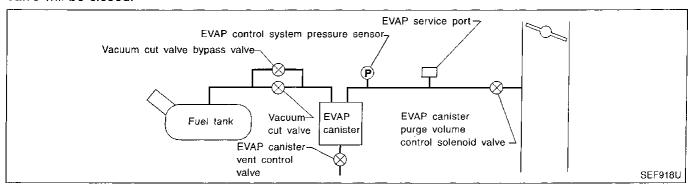

#### NOTE:

### If DTC P0440 is displayed with P1448, perform trouble diagnosis for "DTC P1448" first. (See EC-421.)

This diagnosis detects leaks in the EVAP purge line using engine intake manifold vacuum.

If pressure does not increase, the ECM will check for leaks in the line between the fuel tank and EVAP canister purge volume control solenoid valve, under the following "Vacuum test" conditions.

The vacuum cut valve bypass valve is opened to clear the line between the fuel tank and the EVAP canister purge volume control solenoid valve. The EVAP canister vent control valve will then be closed to shut the EVAP purge line off. The EVAP canister purge volume control solenoid valve is opened to depressurize the EVAP purge line using intake manifold vacuum. After this occurs, the EVAP canister purge volume control solenoid valve will be closed.

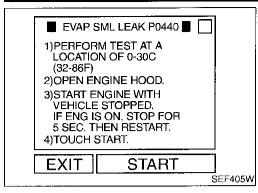

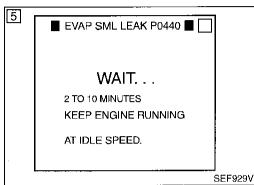

DTC No.	Malfunction is detected when	Check Items (Possible Cause)
P0440 0705	EVAP control system has a leak. #### **CAUTION:**

- Use only a genuine NISSAN fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may come on.
- If the fuel filler cap is not tightened properly, the MIL may come on.
- Use only a genuine NISSAN rubber tube as a replacement.

DTC Confirmation Procedure

### **DTC Confirmation Procedure**

NOTE: If DTC P0440 is displayed with P1448, perform trouble diagnosis for DTC P1448 first. (See EC-421.)

MA

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

EM

G

#### **TESTING CONDITION:**

Perform "DTC WORK SUPPORT" when the fuel level is less than 3/4 full and vehicle is placed on flat level surface.

Always perform test at a temperature of 0 to 30°C (32 to 86°F).

It is better that the fuel level is low.

EC

(A) With CONSULT

FIE

CL

- 1) Turn ignition switch "ON".
- Turn ignition switch "OFF" and wait at least 5 seconds.
  - Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.

Make sure that the following conditions are met. **COOLAN TEMP/S: 0 - 70°C (32 - 158°F)** 

MIT

Front heated oxygen sensors	Density of oxygen in exhaust gas (Mixture ratio feedback signal)			Æ
Tank fuel temperature sensor	Fuel temperature in fuel tank			CL
Vehicle speed sensor	Vehicle speed			

This system controls flow rate of fuel vapor from the EVAP canister. The opening of the vapor by-pass passage in the EVAP canister purge volume control solenoid valve changes to control the flow rate. The EVAP canister purge volume control solenoid valve repeats ON/OFF operation according to the signal sent from the ECM. The opening of the valve varies for optimum engine control. The optimum value stored in the ECM is determined by considering various engine conditions. When the engine is operating, the flow rate of fuel vapor from the EVAP canister is regulated as the air flow changes.

### COMPONENT DESCRIPTION

The EVAP canister purge volume control solenoid valve uses a ON/OFF duty to control the flow rate of fuel vapor from the EVAP canister. The EVAP canister purge volume control solenoid valve is moved by ON/OFF pulses from the ECM. The longer the ON pulse, the greater the amount of fuel vapor that will flow through the

If OK, inspection end. If NG, go to following step.

Check air passage continuity.

Condition PURG VOL CONT/V value	Air passage continuity between A and B	
100.0%	Yes	
0.0%	No	

If NG, replace the EVAP canister purge volume control solenoid valve.

### (R) Without CONSULT

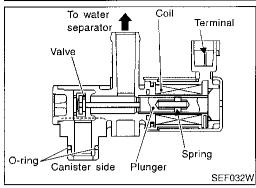

Check air passage continuity.

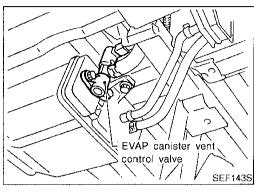

Condition	Air passage continuity between A and B
12V direct current supply between terminals	Yes
No supply	No

If NG or operation takes more than 1 second, replace solenoid valve.

### DTC P0446 EVAPORATIVE EMISSION (EVAP) CANISTER VENT CONTROL VALVE

Component Description

### Component Description

The EVAP canister vent control valve is located on the EVAP canister and is used to seal the canister vent.

This solenoid valve responds to signals from the ECM. When the ECM sends an ON signal, the coil in the solenoid valve is energized. A plunger will then move to seal the canister vent. The ability to seal the vent is necessary for the on board diagnosis of other evaporative emission control system components.

This solenoid valve is used only for diagnosis, and usually remains

When the vent is closed, under normal purge conditions, the evaporative emission control system is depressurized and allows "EVAP Control System (Small Leak)" diagnosis.

#### **DTC Confirmation Procedure**

#### CAUTION:

Always drive vehicle at a safe speed.

#### NOTE:

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

#### **TESTING CONDITION:**

Steps 1 and 2 may be conducted with the drive wheels lifted in the shop or by driving the vehicle. If a road test is expected to be easier, it is unnecessary to lift the vehicle.

#### (P) With CONSULT

- 1) Start engine.
- Perform "VEHICLE SPEED SEN CKT" in "FUNCTION TEST" mode with CONSULT.
- If NG, go to "Diagnostic Procedure", EC-335. If OK, go to following step.

2 VEHICLE SPEED SEN CKT AFTER TOUCH START. DRIVE VEHICLE AT 10km/h (6mph) OR MORE WITHIN 15 sec. **NEXT** START MEF559DA

DTC Confirmation Procedure (Cont'd)

- 4) Select "DATA MONITOR" mode with CONSULT.
- 5) Warm engine up to normal operating temperature.
- Maintain the following conditions for at least 10 consecutive seconds.

CMPS-RPM (REF)	1,400 - 2,800 rpm (A/T models) 2,000 - 3,000 rpm (M/T models)
COOLAN TEMP/S	More than 70°C (158°F)
B/FUEL SCHDL	2.3 - 4.5 msec (A/T models) 3.2 - 5.5 msec (M/T models)
Selector lever	Suitable position
PW/ST SIGNAL	OFF

 If 1st trip DTC is detected, go to "Diagnostic Procedure", EC-335.

#### (P) With CONSULT

- 1) Start engine
- Read "VHCL SPEED SE" in "DATA MONITOR" mode with CONSULT. The vehicle speed on CONSULT should exceed 10 km/h (6 MPH) when rotating wheels with suitable gear position. If NG, go to "Diagnostic Procedure", EC-335.
   If OK, go to following step.
- Select "DATA MONITOR" mode with CONSULT.
- Warm engine up to normal operating temperature.
- Maintain the following conditions for at least 10 consecutive seconds.

CMPS-RPM (REF)	1,400 - 2,800 rpm (A/T models) 2,000 - 3,000 rpm (M/T models)
COOLAN TEMP/S	More than 70°C (158°F)
B/FUEL SCHDL	2.3 - 4.5 msec (A/T models) 3.2 - 5.5 msec (M/T models)
Selector lever	Suitable position
PW/ST SIGNAL	OFF

6) If 1st trip DTC is detected, go to "Diagnostic Procedure", EC-335.

#### **Overall Function Check**

Use this procedure to check the overall function of the vehicle speed sensor circuit. During this check, a 1st trip DTC might not be confirmed.

- 1) Lift up drive wheels.
- 2) Start engine.
- 3) Read vehicle speed sensor signal in "MODE 1" with GST. The vehicle speed sensor on GST should be able to exceed 10 km/h (6 MPH) when rotating wheels with suitable gear position.

Description

# Description SYSTEM DESCRIPTION

NAEC0245

SYSTEM DESCRIPTION NAECO2.			
Sensor	Input Signal to ECM	ECM func- tion	Actuator
Camshaft position sensor	Engine speed		
Mass air flow sensor	Amount of intake air		
Engine coolant temperature sensor	Engine coolant temperature		
Ignition switch	Start signal		
Throttle position sensor	Throttle position		
Park/Neutral position switch	Park/Neutral position		
Air conditioner switch	Air conditioner operation	Idle air control	IACV-AAC valve
Power steering oil pressure switch	Power steering load signal		
Battery	Battery voltage		
Vehicle speed sensor	Vehicle speed		
Ambient air temperature switch	Ambient air temperature		
Intake air temperature sensor	Intake air temperature		
Absolute pressure sensor	Ambient barometic pressure		

This system automatically controls engine idle speed to a specified level. Idle speed is controlled through fine adjustment of the amount of air which bypasses the throttle valve via IACV-AAC valve. The IACV-AAC valve repeats ON/OFF operation according to the signal sent from the ECM. The camshaft position sensor detects the actual engine speed and sends a signal to the ECM. The ECM then controls the ON/OFF time of the IACV-AAC valve so that engine speed coincides with the target value memorized in ECM. The target engine speed is the lowest speed at which the engine can operate steadily. The optimum value stored in the ECM is determined by taking into consideration various engine conditions, such as during warm up, deceleration, and engine load (air conditioner and power steering).

# COMPONENT DESCRIPTION IACV-AAC Valve

NAEC0245502

The IACV-AAC valve is moved by ON/OFF pulses from the ECM. The longer the ON pulse, the greater the amount of air that will flow through the valve. The more air that flows through the valve, the higher the idle speed.

Component Description

## **Component Description**

A closed throttle position switch and wide open throttle position switch are built into the throttle position sensor unit. The wide open throttle position switch is used only for A/T control.

When the throttle valve is in the closed position, the closed throttle position switch sends a voltage signal to the ECM. The ECM only uses this signal to open or close the EVAP canister purge volume control solenoid valve when the throttle position sensor is malfunctioning.

Sensor	Input Signal to ECM	ECM func- tion	Actuator	
Camshaft position sensor	Engine speed			
Ignition switch	Start signal	On board	MAP/BARO switch solenoid	
Throttle position sensor	Throttle position	diagnosis	valve	[
Vehicle speed sensor	Vehicle speed			

This system allows the absolute pressure sensor to monitor either ambient barometric pressure or intake manifold pressure. The MAP/BARO switch solenoid valve switches between two passages by ON-OFF pulse signals from the ECM. (One passage is from the intake air duct, the other is from the intake manifold.) Either ambient barometric pressure or intake manifold pressure is applied to the absolute pressure sensor.

#### COMPONENT DESCRIPTION

The MAP/BARO switch solenoid valve switches its air flow passage according to the voltage signal sent from the ECM. When voltage is supplied from the ECM, the MAP/BARO switch solenoid turns "ON". Then, the absolute pressure sensor can monitor the ambient barometric pressure. When voltage is not supplied from the ECM, the MAP/BARO switch solenoid valve turns "OFF". Then, the sensor monitors intake manifold pressure.

## Component Inspection MAP/BARO SWITCH SOLENOID VALVE

NAEC0286

NAEC0286S01

- (P) With CONSULT
- 1) Start engine and warm it up to normal operating temperature.
- Perform "MAP/BARO SW/V" in "ACTIVE TEST" mode with CONSULT.
- 3) Check the following.
- Condition: At idle under no-load
- CONSULT display

MAP/BARO	ABSOL PRES/SE (Voltage)
BARO	More than 2.6V
MAP	Less than the voltage at BARO
Time for voltage to change	е
MAP/BARO SW/V	Time to switch
BARO to MAP	
MAP to BARO	Less than 1 second

- 4) If NG, check solenoid valve as shown below.
- N Without CONSULT
- 1) Remove MAP/BARO switch solenoid valve.
- 2) Check air passage continuity.

Condition	Air passage continuity between <b>A</b> and <b>B</b>	Air passage continuity between <b>A</b> and <b>C</b>
12V direct current supply between terminals 1 and 2	Yes	No
No supply	No	Yes

 If NG or operation takes more than 1 second, replace solenoid valve.

#### DTC P1148 (RIGHT BANK, -B1), P1168 (LEFT BANK, -B2) CLOSED LOOP CONTROL

- "FR O2 SENSOR" voltage should go above 0.70V at least once.
- "FR O2 SENSOR" voltage should go below 0.21V at least

If the check result is NG, perform "Diagnosis Procedure", EC-366.

EL

### DTC P1148 (RIGHT BANK, -B1), P1168 (LEFT BANK, -B2) CLOSED LOOP CONTROL

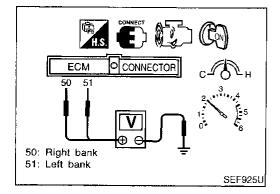

DTC Confirmation Procedure (Cont'd)

If the check result is OK, perform the following step.

- Let engine idle at least 3 minutes.
- Maintain the following condition at least 50 consecutive seconds.

B/FUEL SCHDL	1.7 ms or more (A/T models) 2.0 ms or more (M/T models)
CMPS-RPM (POS)	1,600 - 3,000 rpm (A/T models) 1,900 - 3,000 rpm (M/T models)
Selector lever	Suitable position
VHCL SPEED SE	More than 70 km/h (43 MPH)

6) If DTC is detected, go to "Diagnostic Procedure", EC-366.

#### **Overall Function Check**

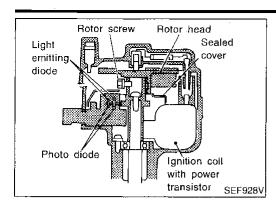

Use this procedure to check the overall function of the closed loop control. During this check, a DTC might not be confirmed.

#### ₩ithout CONSULT

- 1) Start engine and warm it up to normal operating temperature.
- Set voltmeter probes between ECM terminal 50 (front heated oxygen sensor right bank signal) or 51 (front heated oxygen sensor left bank signal) and engine ground.
- Check the following with engine speed held at 2,000 rpm constant under no-load.
- The voltage should go above 0.70V at least once.
- The voltage should go below 0.21V at least once.
- 4) If NG, go to "Diagnostic Procedure", EC-366.

#### **Diagnostic Procedure**

Perform trouble diagnosis for "DTC P0133, P0153", EC-187.

#### Component Description **IGNITION COIL & POWER TRANSISTOR**

NAEC0287

The power transistor switches on and off the ignition coil primary MA

circuit according to the ECM signal. As the primary circuit is turned

on and off, the proper high voltage is induced in the secondary circuit. The distributor is not repairable except for the distributor cap and rotor head.

#### NOTE:

The rotor screw which secures the distributor rotor head to the distributor shaft must be torqued properly.

NAEC0294S01

- Disconnect ignition coil harness connector.
- Check resistance as shown in the figure.

Terminal	Resistance [at 25°C (77°F)]
7 - 8 (Primary coil)	0.5 - 1.0 Ω
7 - 9 (Secondary coil)	Approximately 12 kΩ

For checking secondary coil, remove distributor cap and measure resistance between coil tower metal tip 9 and terminal 7. If NG, replace distributor assembly as a unit.

#### POWER TRANSISTOR

- Disconnect camshaft position sensor & power transistor harness connector and ignition coil harness connector.
- Check power transistor resistance between terminals 2 and 8.

Terminals	Resistance	Result
2 and 8	Except 0Ω	ОК
	0 Ω	NG

If NG, replace distributor assembly.

#### RESISTOR

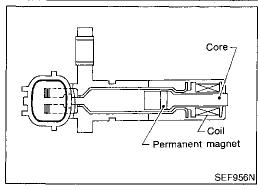

NAEC0294S03

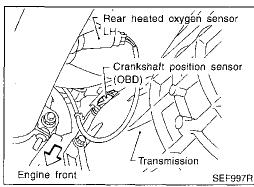

- 1. Disconnect resistor harness connector.
- Check resistance between terminals 1 and 2.

Resistance: Approximately 2.2 kΩ [at 25°C (77°F)] If NG, replace resistor.

#### DTC P1336 CRANKSHAFT POSITION SENSOR (CKPS) (OBD) (COG)

Component Description

#### **Component Description**

The crankshaft position sensor (OBD) is located on the transmission housing facing the gear teeth (cogs) of the flywheel or drive plate. It detects the fluctuation of the engine revolution.

The sensor consists of a permanent magnet, core and coil.

When the engine is running, the high and low parts of the teeth cause the gap with the sensor to change.

The changing gap causes the magnetic field near the sensor to change.

Due to the changing magnetic field, the voltage from the sensor changes.

The ECM receives the voltage signal and detects the fluctuation of the engine revolution.

This sensor is not used to control the engine system.

It is used only for the on board diagnosis.

#### **Component Description**

The EGRC-solenoid valve responds to signals from the ECM. When the ECM sends an ON (ground) signal, the coil in the solenoid valve is energized. The vacuum signal (from the intake manifold collector) passes through the solenoid valve. The signal then reaches the EGR valve.

When the ECM sends an OFF signal, a plunger will then move to cut the vacuum signal.

#### **Component Description**

The EGR temperature sensor detects temperature changes in the EGR passage way. When the EGR valve opens, hot exhaust gases flow, and the temperature in the passage way changes. The EGR temperature sensor is a thermistor that modifies a voltage signal sent from the ECM. This modified signal then returns to the ECM as an input signal. As the temperature increases, EGR temperature sensor resistance decreases.

This sensor is not used to control the engine system. It is used only for the on board diagnosis.

#### <Reference data>

EGR temperature °C (°F)	Voltage* (V)	Resistance (M $\Omega$ )

#### **DTC Confirmation Procedure**

Perform "PROCEDURE FOR MALFUNCTION A" first. If 1st trip DTC cannot be confirmed, perform "PROCEDURE FOR MALFUNCTION B".

#### NOTE:

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

#### PROCEDURE FOR MALFUNCTION A

NAEC0474S01

- (P) With CONSULT
- 1) Turn ignition switch "ON".
- Select "DATA MONITOR" mode with CONSULT.
- 3) Verify that "COOLAN TEMP/S" is less than 40°C (104°F). If the engine coolant temperature is above the range, cool the engine down.
- Start engine and let it idle for at least 8 seconds.
- 5) If 1st trip DTC is detected, go to "Diagnostic Procedure", EC-387.
- **With GST**
- 1) Turn ignition switch "ON".
- 2) Select "MODE 1" with GST.
- 3) Verify that engine coolant temperature is less than 40°C (104°F).

If the engine coolant temperature is above the range, cool the engine down.

- Start engine and let it idle for at least 8 seconds.
- 5) Select "MODE 7" with GST.
- 6) If 1st trip DTC is detected, go to "Diagnostic Procedure", EC-387.
- 🕮 No Tools
- 1) Turn ignition switch "ON".
- Verify that voltage between ECM terminal 59 (engine coolant temperature sensor signal) is more 1.5V.

If the voltage is below the range, cool the engine down.

- 3) Start engine and let it idle for at least 8 seconds.
- 4) Turn ignition switch "OFF" and wait at least 5 seconds.
- 5) Turn ignition switch "ON" and perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.
- 6) If 1st trip DTC is detected, go to "Diagnostic Procedure", EC-387.

# Lift up the EGR valve by hand.

#### PROCEDURE FOR MALFUNCTION B

NAEC0474S02

**CAUTION:** 

Always drive vehicle at a safe speed.

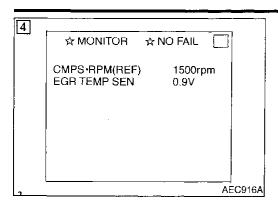

**TESTING CONDITION:** 

Always perform the test at a temperature of 5°C (41°F) or higher.

- (A) With CONSULT
- 1) Start engine and warm it up to normal operating temperature.
- Confirm that EGR valve is not lifting at idle.
   If the check result is NG, go to trouble diagnoses for "DTC P1402". (See pageEC-389.)

#### DTC P1401 EGR TEMPERATURE SENSOR

DTC Confirmation Procedure (Cont'd)

Select "DATA MONITOR" mode with CONSULT.

4) Read "EGR TEMP SEN" at about 1,500 rpm while holding the EGR valve in full open position by hand.

Voltage should decrease to less than 1.5V.

If the check result is NG, go to "Diagnostic Procedure", EC-387.

If the check result is OK, go to following step.

5) Turn ignition switch "OFF" and wait at least 5 seconds.

Turn ignition switch "ON".

 Check the output voltage of "THRTL POS SEN" at closed throttle position and note it.

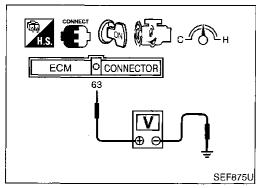

8) Start engine.

 Maintain the following conditions for at least 5 consecutive seconds.

CMPS-RPM (REF)	1,600 - 2,400 rpm (A/T models) 1,800 - 2,600 rpm (M/T models)
B/FUEL SCHDL	3.0 - 4.5 msec
THRTL POS SEN	X - (X + 0.70) V (A/T models) X - (X + 0.66) V (M/T models) X = Voltage value measured at step 7
Selector lever	Suitable position

10) If 1st trip DTC is detected, go to "Diagnostic Procedure", EC-387.

#### **Overall Function Check**

Use this procedure to check the overall function of the EGR temperature sensor. During this check, a 1st trip DTC might not be confirmed.

#### PROCEDURE FOR MALFUNCTION B

#### (R) Without CONSULT

1) Start engine and warm it up to normal operating temperature.

Confirm that EGR valve is not lifting. If NG, go to trouble diagnoses for DTC P0400 and P0402 (See pages EC-289 and 297).

Check voltage between ECM terminal 63 (EGR temperature sensor signal) and ground at about 1,500 rpm with EGR valve lifted up to the full position by hand.

Voltage should decrease to less than 1.5V.

4) If step 4 is OK, perform trouble diagnoses for "DTC P0400 and P1400" (See pages EC-289 and 378).

NAEC0475S01

Sensor	Input Signal to ECM	ECM func-	Actuator	_
Camshaft position sensor	Engine speed			
Mass air flow sensor	Amount of intake air			
Engine coolant temperature sensor	Engine coolant temperature	EGR con- trol	EGRC-solenoid valve	
Ignition switch	Start signal			Ī
Throttle position sensor	Throttle position	,		

LC

EC

EM

MA

This system cuts and controls vacuum applied to the EGR valve to suit engine operating conditions. This cut-and-control operation is accomplished through the ECM and the EGRC-solenoid valve. When the ECM detects any of the following conditions, current does not flow through the solenoid valve. This causes the intake manifold vacuum to be discharged into the atmosphere. The EGR valve remains closed.

Low engine coolant temperature

MT

Engine starting

High-speed engine operation

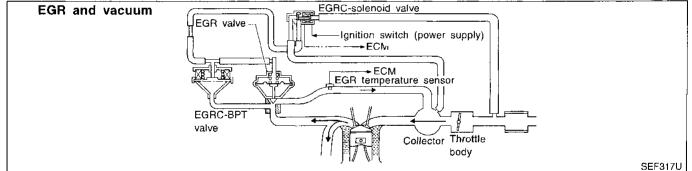

AT

Engine idling

Excessively high engine coolant temperature

TF

Mass air flow sensor malfunction

COMPONENT DESCRIPTION

RS

SEF783K

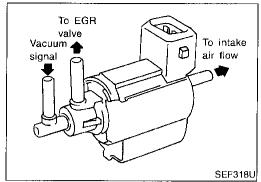

NAEC0475S02

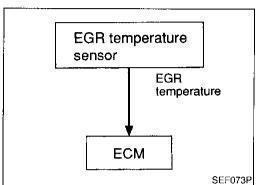

HA

vacuum controls the movement of a taper valve connected to the EL

575

EC-389

#### **EGRC-solenoid Valve**

The EGRC-solenoid valve responds to signals from the ECM. When the ECM sends an ON (ground) signal, the coil in the solenoid valve is energized. The vacuum signal (from the intake manifold collector) passes through the solenoid valve. The signal then reaches the EGR valve.

When the ECM sends an OFF signal, a plunger will then move to cut the vacuum signal.

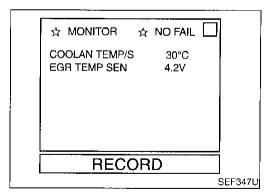

#### On Board Diagnosis Logic

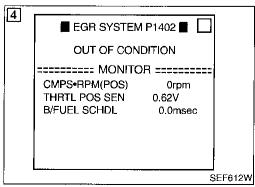

If the EGR temperature sensor detects EGR flow under the condition that does not call for EGR, a high-flow malfunction is diagnosed.

#### NOTE:

Diagnosis for this DTC will end when engine coolant temperature is approx. 50 to 60°C (122 to 140°F). Ignition switch must be turned "ON" (engine start) with engine coolant temperature below 40°C (104°F) when starting DTC confirmation procedure.

DTC No.	Malfunction is detected when	Check Items (Possible Cause)
P1402 0514		<ul> <li>EGRC-solenoid valve</li> <li>EGR valve leaking or stuck open</li> <li>EGR temperature sensor</li> <li>EGRC-BPT valve</li> </ul>

#### **DTC Confirmation Procedure**

NOTE:

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

NAEC0477

#### **TESTING CONDITION:**

- Always perform the test at a temperature of -10°C (14°F) or higher.
- Engine coolant temperature and EGR temperature must be verified in "DATA MONITOR" mode with CONSULT before starting DTC WORK SUPPORT test. If it is out of range below, the test cannot be conducted.

COOLAN TEMP/S: -10 to 30°C (14 to 86°F)\*

EGR TEMP SEN: Less than 4.8V

If the values are out of the ranges indicated above, park the vehicle in a cool place and allow the engine temperature to stabilize. Do not attempt to reduce the engine coolant temperature or EGR temperature with a fan or means other than ambient air. Doing so may produce an inaccurate diagnostic result.

\*: Although CONSULT screen displays "-10 to 40°C (14 to 104°F)" as a range of engine coolant temperature, ignore it.

#### ® With CONSULT

) Turn ignition switch "OFF", and wait at least 5 seconds, and then turn "ON".

2) Select "EGR SYSTEM P1402" of "EGR SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT.

Follow the CONSULT instructions.

 Start engine and let it idle until "TESTING" on CONSULT screen is turned to "COMPLETED". (It will take 60 seconds or more.)

If "TESTING" is not displayed after 5 minutes, turn ignition "OFF" and cool the engine coolant temperature to the range of -10 to 30°C (14 to 86°F). Retry from step 1.

5) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to "Diagnostic Procedure", EC-393.

#### **®** With GST

1) Turn ignition switch "ON" and select "MODE 1" with GST.

2) Check that engine coolant temperature is within the range of -10 to 30°C (14 to 86°F).

3) Check that voltage between ECM terminal 63 (EGR temperature sensor signal) and ground is less than 4.8V.

4) Start engine and let it idle for at least 60 seconds.

5) Stop engine.

6) Perform from step 1 to 4.

7) Select "MODE 3" with GST.

8) If DTC is detected, go to "Diagnostic Procedure", EC-393.

No Tools

1) Turn ignition switch "ON".

Check the following voltages.

ECM terminal 59 (engine coolant temperature sensor signal) and ground:

3.2 - 4.4V

ECM terminal 63 (EGR temperature sensor signal) and ground:

#### Less than 4.8V

3) Start engine and let it idle for at least 60 seconds.

 Turn ignition switch "OFF", wait at least 5 seconds and then turn "ON".

5) Perform "Diagnostic Test Mode II (Self-diagnostic results)" with ECM.

6) If NG, go to "Diagnostic Procedure", EC-393.

When using GST, "DTC Confirmation Procedure" should be performed twice as much as when using CONSULT or ECM (Diagnostic Test Mode II) because GST cannot display MODE 7 (1st trip DTC) concerning this diagnosis. Therefore, using CONSULT or ECM (Diagnostic Test Mode II) is recommended.

On Board Diagnosis Logic

## On Board Diagnosis Logic

NAEC0481

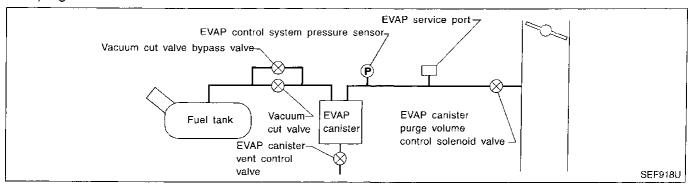

#### NOTE:

#### If DTC P1440 is displayed with P1448, perform trouble diagnosis for "DTC P1448" first. (See EC-421.)

This diagnosis detects leaks in the EVAP purge line using of vapor pressure in the fuel tank.

The EVAP canister vent control valve is closed to shut the EVAP purge line. The vacuum cut valve bypass valve will then be opened to clear the line between the fuel tank and the EVAP canister purge volume control solenoid valve. The EVAP control system pressure sensor can now monitor the pressure inside the fuel tank.

If pressure increases, the ECM will check for leaks in the line between the vacuum cut valve and EVAP canister purge volume control solenoid valve.

DTC No.	Malfunction is detected when	Check Items (Possible Cause)
P1440 0213	EVAP control system has a leak.     EVAP control system does not operate properly.	<ul> <li>Incorrect fuel tank vacuum relief valve</li> <li>Incorrect fuel filler cap used</li> <li>Fuel filler cap remains open or fails to close.</li> <li>Foreign matter caught in fuel filler cap.</li> <li>Leak is in line between intake manifold and EVAP canister purge volume control solenoid valve.</li> <li>Foreign matter caught in EVAP canister vent control valve.</li> <li>EVAP canister or fuel tank leaks</li> <li>EVAP purge line (pipe and rubber tube) leaks</li> <li>EVAP purge line rubber tube bent.</li> <li>Blocked or bent rubber tube to EVAP control system pressure sensor</li> <li>Loose or disconnected rubber tube</li> <li>EVAP canister vent control valve and the circuit</li> <li>EVAP canister purge volume control solenoid valve</li> <li>Absolute pressure sensor</li> <li>Tank fuel temperature sensor</li> <li>MAP/BARO switch solenoid valve</li> <li>Blocked or bent rubber tube to MAP/BARO switch solenoid valve</li> <li>O-ring of EVAP canister vent control valve is missing or damaged.</li> <li>Water separator</li> <li>EVAP canister is saturated with water.</li> <li>EVAP control system pressure sensor</li> </ul>

#### **CAUTION:**

- Use only a genuine NISSAN fuel filler cap as a replacement. If an incorrect fuel filler cap is used, the MIL may come on.
- If the fuel filler cap is not tightened properly, the MIL may come on.
- Use only a genuine NISSAN rubber tube as a replacement.

DTC Confirmation Procedure

#### DTC P1444 EVAPORATIVE EMISSION (EVAP) CANISTER PURGE VOLUME CONTROL SOLENOID VALVE

Description NAEC0325 SYSTEM DESCRIPTION NAEC0325S01 **ECM** Sensor Input Signal to ECM Actuator function Camshaft position sensor Engine speed Mass air flow sensor Amount of intake air Engine coolant temperature sensor Engine coolant temperature Ignition switch Start signal EVAP can-Throttle position Throttle position sensor EVAP canister purge volume ister purge control solenoid valve flow control Throttle position switch Closed throttle position Density of oxygen in exhaust gas Front heated oxygen sensors (Mixture ratio feedback signal) Tank fuel temperature sensor Fuel temperature in fuel tank C/L Vehicle speed sensor Vehicle speed

> This system controls flow rate of fuel vapor from the EVAP canister. The opening of the vapor by-pass passage in the EVAP canister purge volume control solenoid valve changes to control the flow rate. The EVAP canister purge volume control solenoid valve repeats ON/OFF operation according to the signal sent from the ECM. The opening of the valve varies for optimum engine control. The optimum value stored in the ECM is determined by considering various engine conditions. When the engine is operating, the flow rate of fuel vapor from the EVAP canister is regulated as the air flow changes.

#### COMPONENT DESCRIPTION

The EVAP canister purge volume control solenoid valve uses a ON/OFF duty to control the flow rate of fuel vapor from the EVAP canister. The EVAP canister purge volume control solenoid valve is moved by ON/OFF pulses from the ECM. The longer the ON pulse, the greater the amount of fuel vapor that will flow through the valve.

#### CONSULT Reference Value in Data Monitor Mode

Component Description

## **Component Description**

The EVAP canister vent control valve is located on the EVAP canister and is used to seal the canister vent.

This solenoid valve responds to signals from the ECM. When the ECM sends an ON signal, the coil in the solenoid valve is energized. A plunger will then move to seal the canister vent. The ability to seal the vent is necessary for the on board diagnosis of other evaporative emission control system components.

This solenoid valve is used only for diagnosis, and usually remains opened.

When the vent is closed, under normal purge conditions, the evaporative emission control system is depressurized and allows "EVAP Control System (Small Leak)" diagnosis.

MT

NOTE:

#### If DTC P1447 is displayed with P0510, perform trouble diagnosis for "DTC P0510" first. (See EC-343.)

In this evaporative emission (EVAP) control system, purge flow occurs during non-closed throttle conditions. Purge volume is related to air intake volume. Under normal purge conditions (non-closed throttle), the EVAP canister purge volume control solenoid valve is open. Purge flow exposes the EVAP control system pressure sensor to intake manifold vacuum.

On Board Diagnosis Logic

Under normal conditions (non-closed throttle), sensor output voltage indicates if pressure drop and purge flow are adequate. If not, a fault is determined.

DTC No.	Malfunction is detected when	Check Items (Possible Cause)

DTC Confirmation Procedure

#### **DTC Confirmation Procedure**

**CAUTION:** 

Always drive vehicle at a safe speed.

NOTE:

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

NAEC0338

#### **TESTING CONDITION:**

Always perform test at a temperature of 5°C (41°F) or more. (A) With CONSULT

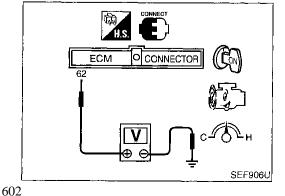

- 1) Start engine and warm it up to normal operating temperature.
- 2) Turn ignition switch "OFF" and wait at least 5 seconds.
- 3) Start engine and let it idle for at least 70 seconds.
- 4) Select "PURG FLOW P1447" of "EVAPORATIVE SYSTEM" in "DTC CONFIRMATION" mode with CONSULT.
- 5) Touch "START".

  If "COMPLETED" is displayed, go to step 7.
- 6) When the following conditions are met, "TESTING" will be displayed on the CONSULT screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take at least 35 seconds.)

Selector lever	Suitable position
Vehicle speed	32 - 120 km/h (20 - 75 MPH)
CMPS-RPM (POS)	500 - 3,400 rpm
B/FUEL SCHDL	Less than 4 msec
Engine coolant temperature	70 - 100°C (158 - 212°F)

# If "TESTING" is not changed for a long time, retry from step 2.

7) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to "Diagnostic Procedure", EC-417.

#### **Overall Function Check**

Use this procedure to check the overall monitoring function of the EVAP control system purge flow monitoring. During this check, a 1st trip DTC might not be confirmed.

#### **⋈** Without CONSULT

- 1) Lift up drive wheels.
- 2) Start engine and warm it up to normal operating temperature.
- Turn ignition switch "OFF", wait at least 5 seconds.
- 4) Start engine and wait at least 70 seconds.
- 5) Set voltmeter probes to ECM terminals 62 (EVAP control system pressure sensor signal) and ground.

#### **DTC Confirmation Procedure**

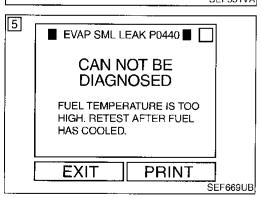

#### NOTE:

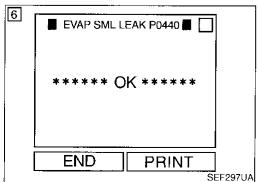

NAEC0497

- If DTC P1448 is displayed with P0440, perform trouble diagnosis for DTC P1448 first.
- If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

# (F) With CONSULT TESTING CONDITION:

- Perform "DTC WORK SUPPORT" when the fuel level is less than 3/4 full and vehicle is placed on flat level surface.
- Always perform test at a temperature of 0 to 30°C (32 to 86°F).
- It is better that the fuel level is low.
- 1) Turn ignition switch "ON".
- 2) Turn ignition switch "OFF" and wait at least 5 seconds.
- Turn ignition switch "ON" and select "DATA MONITOR" mode with CONSULT.
- 4) Make sure that the following conditions are met.

COOLAN TEMP/S	0 - 70°C (32 - 158°F)
INT/A TEMP SE	0 - 60°C (32 - <b>1</b> 40°F)

5) Select "EVAP SML LEAK P0440" of "EVAPORATIVE SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT. Follow the instruction displayed.

#### NOTE:

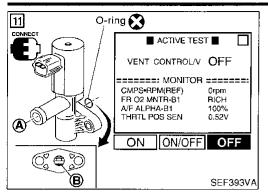

- If the CONSULT screen shown at left is displayed, stop the engine and stabilize the vehicle temperature at 25°C (77°F) or cooler. After "TANK F/TMP SE" becomes less than 30°C (86°F), retest.
  - (Use a fan to reduce the stabilization time.)
- If the engine speed cannot be maintained within the range displayed on the CONSULT screen, go to "Basic Inspection", EC-86.
- The engine idle portion of this test (See illustration at left.)
   will take approximately 5 minutes.
- 6) Make sure that "OK" is displayed. If "NG" is displayed, go to the following step.

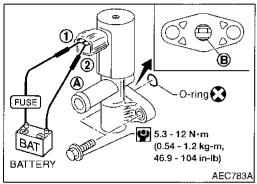

#### NOTE:

Make sure that EVAP hoses are connected to EVAP canister purge volume control solenoid valve properly.

- Stop engine and wait at least 5 seconds, then turn "ON".
- 8) Disconnect hose from water separator.
- Select "VENT CONTROL/V" of "ACTIVE TEST" mode with CONSULT.
- 10) Touch "ON" and "OFF" alternately.

DTC Confirmation Procedure (Cont'd)

11) Make sure the following.	
Condition VENT CONTROL/V	Air passage continuity between <b>A</b> and <b>B</b>
ON	No
OFF	Yes

If the result is NG, go to "Diagnostic Procedure", EC-425. If the result is OK, go to "Diagnostic Procedure" for DTC P0440, EC-306.

## **Overall Function Check**

Use this procedure to check the overall function of the EVAP canister vent control valve circuit. During this check, a DTC might not be confirmed.

#### **⋈** Without CONSULT

- 1) Disconnect hose from water separator.
- Disconnect EVAP canister vent control valve harness connector.
- 3) Verify the following.

Condition	Air passage continuity
12V direct current supply between terminals 1 and 2	No
No supply	Yes

If the result is NG, go to "Diagnostic Procedure", EC-425. If the result is OK, go to "Diagnostic Procedure" for DTC P0440, EC-306.

# **DTC Confirmation Procedure**

NAEC0514

#### **CAUTION:**

Always drive vehicle at a safe speed.

#### NOTE:

If "DTC Confirmation Procedure" has been previously conducted, always turn ignition switch "OFF" and wait at least 5 seconds before conducting the next test.

#### **TESTING CONDITION:**

Always perform test at a temperature of 5 to 30°C (41 to 86°F). (A) With CONSULT

- 1) Turn ignition switch "ON".
- 2) Start engine and warm it up to normal operating temperature.
- 3) Turn ignition switch "OFF" and wait at least 5 seconds.
- 4) Start engine and let it idle for at least 70 seconds.
- 5) Select "VC CUT/V BP/V P1491" of "EVAPORATIVE SYSTEM" in "DTC WORK SUPPORT" mode with CONSULT.
- Touch "START".
- 7) When the following conditions are met, "TESTING" will be displayed on the CONSULT screen. Maintain the conditions continuously until "TESTING" changes to "COMPLETED". (It will take at least 30 seconds.)

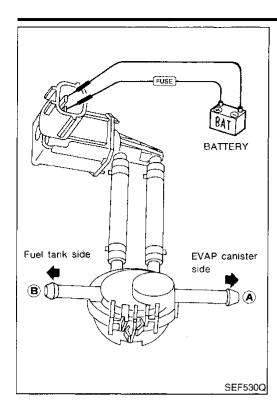

CMPS-RPM (POS)	500 - 3,300 rpm (M/T) 500 - 3,000 rpm (A/T)
Selector lever	Suitable position
Vehicle speed	36 - 120 km/h (22 - 75 MPH)
B/FUEL SCHDL	Less than 5 msec

# If "TESTING" is not displayed after 5 minutes, retry from step 3.

8) Make sure that "OK" is displayed after touching "SELF-DIAG RESULTS". If "NG" is displayed, refer to "Diagnostic Procedure", EC-437.

#### DTC P1491 VACUUM CUT VALVE BYPASS VALVE

Overall Function Check

#### Overall Function Check

NAEC0515

Use this procedure to check the overall function of vacuum cut valve bypass valve. During this check, the 1st trip DTC might not be confirmed.

#### Nithout CONSULT

Remove vacuum cut valve and vacuum cut valve bypass valve as an assembly.

MA

G

Apply vacuum to port A and check that there is no suction from port **B**.

Apply vacuum to port B and check that there is suction from port A.

EC

Blow air in port B and check that there is a resistance to flow out of port A.

Supply battery voltage to the terminal. 5)

6) Blow air in port A and check that air flows freely out of port B.

Blow air in port B and check that air flows freely out of port A. 7) If NG, go to "Diagnostic Procedure", EC-437.

Component Description

#### **Component Description**

When the gear position is "P" (A/T models only) or "N", park/neutral position (PNP) switch is "ON".

ECM detects the position because the continuity of the line (the "ON" signal) exists.

For A/T models, the park/neutral position (PNP) switch assembly also includes a transmission range switch to detect selector lever position.

MONITOR ITEM

INJ PULSE-B2

**INJ PULSE-B1** 

B/FUEL SCHDL

## **Component Description**

The fuel injector is a small, precise solenoid valve. When the ECM supplies a ground to the injector circuit, the coil in the injector is energized. The energized coil pulls the needle valve back and allows fuel to flow through the injector into the intake manifold. The amount of fuel injected depends upon the injection pulse duration. Pulse duration is the length of time the injector remains open. The ECM controls the injection pulse duration based on engine fuel needs.

System Description					G[	
Sensor	Input Signal to ECM	ECM func- tion	Actuator		MA	
Camshaft position sensor	Engine speed	Fuel pump	Fuel nump roley			
Ignition switch	Start signal	control	Fuel pump relay			

The ECM activates the fuel pump for several seconds after the ignition switch is turned on to improve engine startability. If the ECM receives a 120° signal from the camshaft position sensor, it knows that the engine is rotating, and causes the pump to operate. If the 120° signal is not received when the ignition switch is on, the engine stalls. The ECM stops pump operation and prevents battery discharging, thereby improving safety. The ECM does not directly drive the fuel pump. It controls the ON/OFF fuel pump relay, which in turn controls the fuel pump.

Condition	Fuel pump operation	 
Ignition switch is turned to ON.	Operates for 5 seconds	
Engine running and cranking	Operates	 CL

## Component Inspection

POWER STEERING OIL PRESSURE SWITCH

NAEC0364

Disconnect power steering oil pressure switch harness connector then start engine.

Check continuity between terminals 1 and 2.

	ST
<del></del>	RS

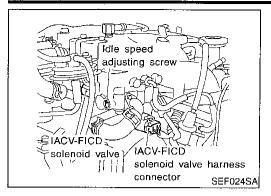

Conditions	Continuity	
Steering wheel is being fully turned	Yes	
Steering wheel is not being turned	No	

If NG, replace power steering oil pressure switch.

BT

SC

## **Component Description**

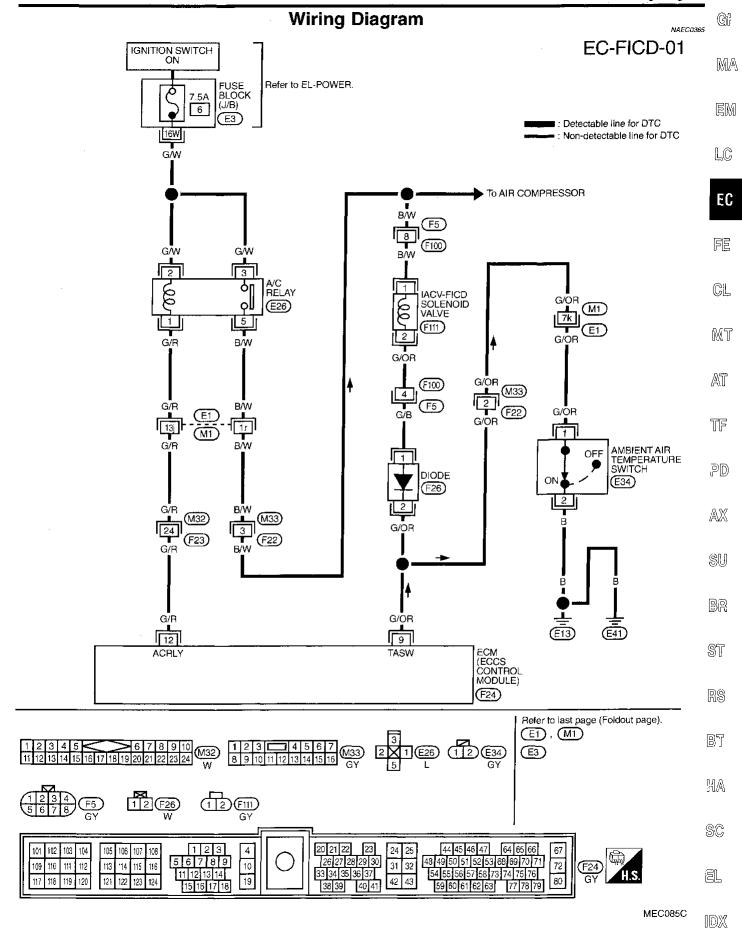

When the air conditioner is on, the IACV-FICD solenoid valve supplies additional air to adjust to the increased load. For more information, refer to "DESCRIPTION" in HA section.

#### **ECM Terminals and Reference Value**

Specification data are reference values and are measured between each terminal and 32 (ECM ground).

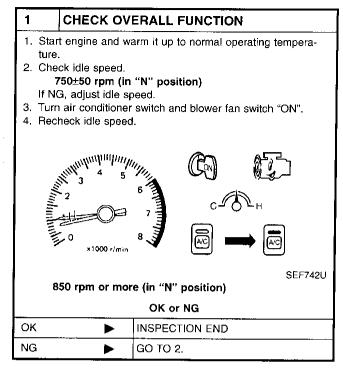

TERMI- NAL NO.	WIRE COLOR	ITEM	CONDITION	DATA (DC Voltage)
		Ambient air temperature switch	[Engine is running]  Idle speed  Ambient air temperature is above 23.5°C (74°F)  Air conditioner is operating	ov
9	G/OR		<ul> <li>[Engine is running]</li> <li>Idle speed</li> <li>Ambient air temperature is below 23.5°C (74°F)</li> <li>Air conditioner is operating</li> </ul>	BATTERY VOLTAGE (11 - 14V)
			<ul> <li>[Engine is running]</li> <li>Idle speed</li> <li>Ambient air temperature is below 23.5°C (74°F)</li> <li>Air conditioner is not operating</li> </ul>	Approximately 5V
12	0/0	Air conditioner relay	[Engine is running]  • Both A/C switch and blower fan switch are "ON"*	0 - 1V
12	12   G/R		[Engine is running] • A/C switch is "OFF"	BATTERY VOLTAGE (11 - 14V)
21	21 B/W	W Air conditioner switch	[Engine is running] ■ Both A/C switch and blower fan switch are "ON" (Compressor operates)*	Approximately 0V
			[Engine is running]  ◆ Air conditioner switch is "OFF"	Approximately 5V

<sup>\*:</sup> Any mode except "OFF", ambient air temperature is above 23.5°C (74°F).

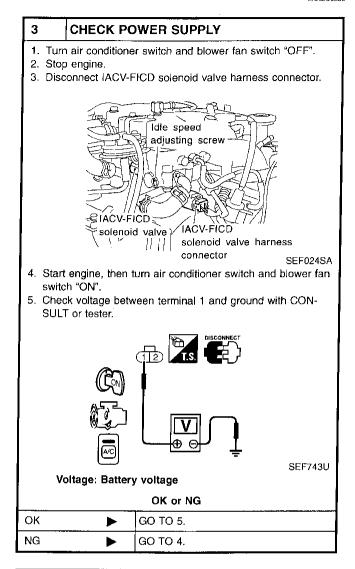

## **Diagnostic Procedure**

=NAEC0368

2	CHECK AIR	R CONDITIONER FUNCTION
Check	if air conditione	er compressor functions normally.
OK or NG		
ок	<b>•</b>	GO ТО 3.
NG	<b>&gt;</b>	Refer to HA section ("TROUBLE DIAGNOSES").

#### 4 DETECT MALFUNCTIONING PART

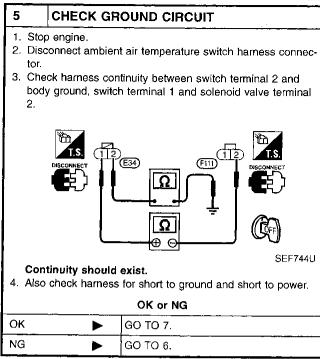

Check the following.

- Harness connectors F5, F100
- Harness for open or short between IACV-FICD solenoid valve and harness connector F22

Repair harness or connectors.

## **IACV-FICD SOLENOID VALVE**

Diagnostic Procedure (Cont'd)

	OK or NG		
ок	<b></b>	GO TO 7.

## **SERVICE DATA AND SPECIFICATIONS (SDS)**

Fuel Pressure Regulator

Fu	el Pressure Regulator
Fuel pressure at idling kPa (kg/cm², psi)	
Vacuum hose is connected	Approximately 235 (2.4, 34)
Vacuum hose is disconnected	Approximately 294 (3.0, 43)

## Idle Speed and Ignition Timing

NAEC0372

Base idle speed*1	No-load*4 (in "P" or N" position)	700+50 rpm
Target idle speed*2	No-load*4 (in "P" or N" position)	750±50 rpm
Air conditioner: ON	In "P" or N" position	850 rpm or more
Ignition timing*3	In "P" or N" position	15°±2° BTDC
Throttle position sensor idle position	n	0.15 - 0.85V

<sup>\*1:</sup> Throttle position sensor harness connector disconnected or using CONSULT "WORK SUPPORT" mode

- Air conditioner switch: OFF
- Electric load: OFF (Lights, heater fan & rear window defogger)
- Steering wheel: Kept in straight-ahead position

## **Ignition Coil**

NAEC0373

Primary voltage	12 V
Primary resistance [at 20°C (68°F)]	Approximately 1.0 Ω
Secondary resistance [at 20°C (68°F)]	Approximately 10 kΩ

#### Mass Air Flow Sensor

NAEC0374

Supply voltage	Battery voltage (11 - 14) V
Output voltage at idle	1.0 - 1.7* V
Mass air flow (Using CONSULT or GST)	3.3 - 4.8 g·m/sec at idle* 12.0 - 14.9 g·m/sec at 2,500 rpm*

<sup>\*:</sup> Engine is warmed up sufficiently and running under no-load.

## **Engine Coolant Temperature Sensor**

NAEC0375

Temperature °C (°F)	Resistance kΩ
20 (68)	2.1 - 2.9
50 (122)	0.68 - 1.00
90 (194)	0.236 - 0.260

#### **EGR Temperature Sensor**

NAEÇ0376

EGR temperature °C (°F)	Voltage (V)	Resistance (M $\Omega$ )
0 (32)	4.81	7.9 - 9.7
50 (122)	2.82	0.57 - 0.70
100 (212)	0.8	0.08 - 0.10

## Front Heated Oxygen Sensor Heater

NAEC0377

,	
D	22.420
