

"There's nothing better." — LARS BROGAARD FOH Engineer

**The Rod Stewart Human Tour System:**

Four Electro-Voice X-Line line arrays with 11 cabinets each  
Up to 22 X-Line Xsub subwoofers  
More than 65 Electro-Voice P3000 amplifiers  
Klark-Teknik® DN9848 loudspeaker processors  
Midas® XL4 console for front-of-house mix  
Two Midas® XL4 consoles for monitor mix

Taidus Vallandi System Technician  
Lars Brogaard FOH Engineer

Night after night, Lars Brogaard and Taidus Vallandi deliver the excitement of Rod Stewart's *Human* tour to every seat in the house. They do it with the awesome range and clarity of Electro-Voice® X-Line™ line arrays. Lars says "It's the best line array system going. There's nothing better. Unlike other line array systems, you can hear the high-hat. You can hear sibilance and subtleties of the voice with no radical EQ boost." Taidus concurs, "X-Line is the first line array we've used that comfortably handles a range of 200 feet and more. You walk out that far from the stage and the full-range sound is still right there, very present."

Lars is one of the most experienced line array users in the business. He likes what he hears from X-Line. So do Rod Stewart's fans. So will you.

*Concept*

X-Line is a highly flexible line array system which provides superb stereo imaging, multiple coverage patterns, easy rigging, and Electro-Voice RMD® Ring Mode Decoupling technology in every cabinet.

*Rigging*

Proprietary EV® backbone hinge/front chain rigging allows up to four X-Line cabinets per dolly. Safe, fast load-in/out with efficient truck pack. Arrays can be landed and reconfigured for coverage needs without de-rigging the entire cluster.

*Pattern Control*

Unlike other line array systems, X-Line moves the HF section to the side, allowing for an unobstructed mid-bass section that helps prevent lobing. This gives you optimum pattern control throughout the vocal range. The flat panel radiators provide consistent wave-guide flares without reflections or resonance.

*Hydra*

The high-frequency section couples the exclusive EV® Hydra™ vertical plane wave generator with our ND5A compression drivers. Uniform amplitude and phase over the entire vertical plane produces exceptionally smooth summing.

*Downfill Coverage*

Our Xvls™ cabinets use a 90° pattern for long throw. The Xvlt™ cabinets are for the "J" curve. The Xsub™ subwoofers are the same size and can be ground-stacked or flown for even distribution and accurate arrival times. But the key for a seamless front to back fill is the Xfil™ enclosure. With its wide 120° horizontal and 40° vertical patterns, it's critical to maintaining even coverage for near throw fill while preserving line-array coherence.

For everyone who wants a higher level of performance—  
Step up to Electro-Voice's X-Line.
