## CHAPTER 1 INTRODUCTION

## 1. General

This manual provides the circuit card description for the NEAX2400 IMX system.
This manual is for those persons who are involved in the system setup and administration activities for the NEAX2400 IMX. For each circuit card the following items are explained:

- General function
- Slot to mount the circuit card
- Precautions for mounting the card
- Location of the electronic devices on the card surface
- Description of the LED
- Description of the switches
- Physical interface

The circuit cards explained in this manual are divided into two categories, the Control Circuit Cards and the Line/Trunk Circuit Cards. You can easily define the card category by the pull tab color of the circuit card.

- Control Circuit Card

White or red pull tab circuit cards are categorized as control circuit card. Also, the circuit cards in the Central Processor Rack (CPR) have white or red pull tabs.

- Line/Trunk Circuit Card

Blue or yellow pull tab circuit cards are categorized as line/trunk circuit cards.
Note: This manual is intended to describe only the basic line/trunk interface circuit cards of the NEAX2400 IMX. When you use circuit cards not shown in this manual, you may refer to the NEAX2400 ICS Circuit Card Manual with the following changes:

- The line/trunk circuit card shown in the above mentioned manual is compatible with NEAX2400 IMX; however, the exceptions are PA-CS02-C (2AT1) and PA-CS08B (H/MATI).
- The external appearance of PIM U (which is the standard port interface module of NEAX2400 IMX) is the same as the PIM J of the NEAX2400 ICS.
- The PCM highway running in PIM is different. More details are explained in this manual's section on PH-PC36 (MUX).

## INTRODUCTION

Mounting Location of Circuit Card

## 2. Mounting Location of Circuit Card

The control circuit cards for the 1 IMG system should be mounted in their dedicated slots, as shown in Figure $1-1$. The control circuit cards for the 4 IMG system should be mounted in their dedicated slots, as shown in Figure 1-2 through Figure 1-2. The control circuit cards for the IMX-U system should be mounted in their dedicated slots as shown in Figure 1-3 through Figure 1-3.

As a general rule, the blue pull tab line/trunk circuit cards are mounted in the universal slots that are located in Slots 04-12 and 15-23 of the Port Interface Module (PIM).

The yellow pull tab line/trunk circuit cards (MISC) are mounted in Slots 00-02 of the LPM.
Additional GT/LANI cards are mounted in the CPR.

## CHAPTER 2 CONTROL CIRCUIT CARD REFERENCE

This chapter explains the following items for each Control Circuit Card.

- General Function

Explains the general function and purpose of each control circuit card.

- Mounting Location/Condition

Explains the mounting location (mounting module name and slot number, etc.) for each circuit card. If there are any conditions pertaining to mounting the circuit cards, they are also explained.

- Face Layout of Lamps, Switches, and Connectors

The locations of the lamps, switches, and connectors provided on each circuit card are illustrated by a face layout.

- Lamp Indications

The names, colors, and indication states of lamps mounted on each circuit card are listed.

- Switch Settings

Each circuit card's switches are listed with their names, switch numbers, their setting and its meaning, standard setting, etc.

- External Interface

If the lead outputs of the circuit card are provided by an LT connector, the relation between the mounting slots and the LT connectors is illustrated by an LT Connector Lead Face Layout. If the lead outputs are provided by other than an LT connector, or are provided by the circuit card front connector, the connector lead locations and the connecting routes are shown.

In addition, a Switch Setting Sheet, which may be used to record the switch settings, is provided at the end of the explanation for each circuit card.

## SN1374 CPRP-A <br> CPU Board

1. General Function

The Central Processing Rack (CPR) consists of the following components.
(a) CPU BOARD: Contains the Main Processor Unit (MPU), ROM, and 128 Mbyte of Random Access Memory (RAM). Also, this board may be equipped with the ISAGT (PZ-GT16) on its Industrial Standard Architecture (ISA) and LANI (PZ-PC19) on the Peripheral Component Interconnect (PCI).
(b) DSP: Contains the CPR switches and the CPR status indicator lamps.
(c) FDD/HDD: Floppy Disk Drive (FDD) and Hard Disk Drive (HDD) are mounted on a circuit card, which can be extracted and/or inserted while the system is in operation, if required.
(d) PWR: Supplies the operating power to the CPR, and also the MISC slots of the LPM.

Figure 2-1 Location of SN1374 CPRP-A (CPR) in the System
2. Mounting Location/Condition

The CPR is composed of a CPU BOARD, DSP, FDD/HDD and PWR, and is located in the Local Processor Module (LPM) as shown below. Since the CPR provides the Industry Standard Architecture (ISA) bus and Peripheral Component Interconnect (PCI) bus, the GT and LANI cards are located in those busses respectively.

## Mounting Module LPM

Figure 2-2 CPR Location
3. Face Layout of Lamps, Switches and Connectors

The CPR has the following lamps, switches and connectors.
Slot numbers 0-3 provide the Peripheral Component Interconnect (PCI) bus, and slot numbers 4-6 are the Industrial Standard Architecture (ISA) bus.

Figure 2-3 Front View of CPR
4. Lamp Indications

| LAMP NAME | COLOR | DESCRIPTION |
| :---: | :---: | :--- |
| ON (PWR) | Green | Lights green when the PWR is supplied. |
| ALM (PWR) | Red | Lights red when the PWR is abnormal. |

## SN1401 CPRAC-A

CPU Board

## SN1401 CPRAC-A <br> CPU Board

1. General

The CPR consists of the following components.
(a) CPU BOARD: Contains the Main Processor Unit (MPU), ROM, and 128 Mbyte of Random Access Memory (RAM). Additionally, this board may be equipped with the ISAGT (PZGT13) on its Industrial Standard Architecture (ISA) bus, and LANI (PZ-PC19) on the Peripheral Component Interconnect (PCI).
(b) DSP: Contains the CPR switches and the CPR status indicator lamps.
(c) FDD/HDD: Floppy Disk Drive (FDD) and Hard Disk Drive (HDD) are mounted on a circuit card, which can be extracted and/or inserted while the system is in operation, if necessary.
(d) PWR: Supplies the operating power to the CPR and also the MISC slots of the LPM.

Figure 2-4 Location of SN1401 CPRAC-A (CPR) in the System
2. Mounting Location/Condition

The CPR is composed of the CPU BOARD, DSP, FDD/HDD, and PWR and is located in the Local Processor Module (LPM) as shown below. Since the CPR provides the Industrial Standard Architecture (ISA) bus and Peripheral Component Interconnect (PCI) bus, the GT and LANI cards are located in those busses respectively.

Figure 2-5 CPR Location

## SN1401 CPRAC-A

## CPU Board

3. Face Layout of Lamps, Switches, and Connectors

The CPR has the following lamps, switches and connectors.
Slots 0-3 provide the Peripheral Component Interconnect (PCI) bus, and Slots 4-6 are the Industrial Standard Architecture (ISA) bus.

Figure 2-6 Front View of CPR

## PH-GT09

Gate

1. General Function

The PH-GT09 (GT) circuit card provides both the TSW I/O Local bus and the MISC bus interface. The CPR controls TSW, PLO, DLKC, and MISC via the ISAGT and GT.

Figure 2-7 Location of PH-GT09 (GT) Card in the System
2. Mounting Location/Condition

This circuit card is mounted in the TSWM of the slot shown below.

| Mounting Module TSWM |

## SN1455 CPRAQ-A/SN1531 CPRAS-A

 CPU Board1. General Function

The CPR consists of the following components.
(a) CPU BOARD: Contains the Main Processor Unit (MPU), ROM, and 128 Mbyte of Random Access Memory (RAM). This board may also contain the ISAGT (PZ-GT13/PZ-GT20) on its Industrial Standard Architecture (ISA) bus, and LANI (PZ-PC19) on the Peripheral Component Interconnect (PCI).
(b) DSP: Contains the CPR switches and the CPR status indicator lamps.
(c) FDD/HDD: Floppy Disk Drive (FDD) and Hard Disk Drive (HDD) are mounted on a circuit card, which, if necessary, can be extracted and/or inserted while the system is in operation.
(d) PWR: Supplies the operating power to the CPR and also the MISC slots of the LPM.

Figure 2-9 Location of SN1455 CPRAQ-A/SN1531 CPRAS-A (CPR)
2. Mounting Location/Condition

The CPR is composed of the CPU BOARD, DSP, FDD/HDD, and PWR and is located in the Local Processor Module (LPM) as shown in Figure 2-10. Since the CPR provides the Industrial Standard Architecture (ISA) bus and Peripheral Component Interconnect (PCI) bus, the ISAGT and LANI cards are located in those busses respectively.

Note: This card is mounted in the IMG0 of the IMX-U system only.

Figure 2-10 CPR Location
3. Face Layout of Lamps, Switches, and Connectors

The CPR contains the following lamps, switches and connectors.
Slots 0-3 provide the Peripheral Component Interconnect (PCI) bus, and Slots 4-6 are the Industrial Standard Architecture (ISA) bus.

Note: $\quad$ This card is mounted in the IMG0 of the IMX-U system only.

Figure 2-11 Front View of CPR
4. Lamp Indications

Lamp Indications vary depending on the node. The following shows the lamp indications for the CPR in the IMG.

| LAMP NAME | COLOR | DESCRIPTION |
| :---: | :---: | :--- |
| ON (PWR) | Green | Lights green when the PWR is supplied. |
| ALM (PWR) | Red | Lights red when the PWR is abnormal. |
| HDD <br> (FDD/HDD) | Red | Lights red while the HDD or FDD is being accessed. |
| WDT (DSP) | Red | Lights red when Watch-dog Timer (WDT) time-out has occurred. |
| CPU OPE (DSP) | Green | Lights green when the CPU is in active state. |
| CPU OPE (DSP) | Green | Lights green when the CPU is in active state. |

| LAMP NAME | COLOR | DESCRIPTION |
| :---: | :---: | :--- |
| IMG0 (DSP) | Green | Flashes green when PZ-GT13 (located in slot number 6) is in operation. |
| IMG1 (DSP) | Green | Flashes green when IMG1 is mounted. Note |
| IMG2 (DSP) | Green | Flashes green when IMG2 is mounted. Note |
| IMG3 (DSP) | Green | Flashes green when IMG3 is mounted. Note |

Note: No lamp indication in STBY mode.
The following shows the lamp indication for the CPR in the ISW

| LAMP NAME | COLOR |  |
| :---: | :---: | :--- |
| ON (PWR) | Green | Lights green when the PWR is supplied. |
| ALM (PWR) | Red | Lights red when the PWR is abnormal. |
| HDD (FDD/HDD) | Red | Lights red while the HDD or FDD is being accessed. |
| WDT (DSP) | Red | Lights red when Watch-dog Timer (WDT) time-out has occurred. |
| CPU OPE (DSP) | Green | Lights green when the CPU of the ISW is in active state. |
| IMG0 (DSP) | Green | Lights green when the CPU of the ISW is in active state. |
|  |  |  |
| IMG1 (DSP) | Green | Lights green when the TSW1 of the ISW is used. Note |
| IMG2 (DSP) | Green | Lights green when the TSW2 of the ISW is used. Note |
| IMG3 (DSP) | Green | Lights green when the TSW3 of the ISW is used. Note |

Note: No lamp indication in STBY mode.

| LAMP NAME | DESCRIPTION |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| STATUS (DSP) | Two sets of "7-segment LED" show the CPR processing status. The CPR processing status is determined by the SENSE switch settings, and the new processing status starts when the CPURST switch is pressed. The 7 -segment LED indication on each CPR processing status is listed below. |  |  |  |
|  |  |  | rus | DESCRIPTION |

## PH-GT10 <br> Input Output Gate

1. General Function

The PH-GT10 circuit card provides the TSW I/O bus interface for permitting the CPU board to control the TSW, HSW, and PLO cards within the Inter-node Switch Module (ISWM) of the ISW. Additionally, this circuit card is equipped with the copy function to be consistent with the data of TSW I/O bus in both systems (single/dual). This circuit card is used for the IMX-U system.

| MB | $\square$ | ON |
| MBR | Note: Normal operating mode is down. |  |

## PA-PC94

## Data Link Multiplexer

1. General Function

This circuit card mainly provides the two functions: 1) collection of BLF/TGBL information (associated with Attendant/Desk Console operation) from DLKC cards of all nodes in an IMX-U system, and 2) distribution of the collected data to ATI cards of all nodes. While a DLKC card can manage this processing solely on an accommodated node basis, the use of this card makes possible the BLF/TGBL management even on a system basis, via the Inter-node Switch (ISW). Note that this card is mounted in a PIM of any node, and if necessary, can have an optional dual configuration.

For details on BLF/TGBL information, refer to the following service features explained in the "Feature Programming Manual".

- Busy Lamp Field-Flexible [B-2]
- Trunk Group Busy Lamp [T-9]

This figure shows an example where a pair of DLMX cards (No. 0/No. 1 system) is accommodated in a PIM of LN0.

Note: IN - DLMX card gathers BLF/TGBL information from DLKC card of each node, viaISW. OUT - DLMX card sends the collected BLF/TGBL information to ATI card(s) of each node, via ISW.

Figure 2-14 Location of PA-PC94 (DLMX)
2. Mounting Location/Condition

- When this circuit card is used in a single configuration.

Mount this circuit card in any of the shaded slots

| Mounting Module | PIM |
| :--- | :--- |

| 00 01 02 03 | 04 | 05 | 06 | 07 | 08 | 09 | 10 | 11 | 12 | 1314 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { 므́ } \\ & \frac{3}{3} \\ & \hline \end{aligned}$ |  | $\begin{aligned} & \text { 믄 } \\ & \frac{3}{3} \end{aligned}$ |  | $\begin{aligned} & \text { 믄 } \\ & \frac{3}{3} \end{aligned}$ |  |  |  |  |  | $\begin{aligned} & \text { 므́ } \\ & \frac{3}{3} \\ & \hline \end{aligned}$ |  | $\begin{aligned} & \text { 믄 } \\ & \frac{3}{3} \\ & \hline \end{aligned}$ |  | $\begin{aligned} & \text { 믄 } \\ & \frac{3}{3} \\ & \hline \end{aligned}$ |  |  |  |  |

Mounting Condition
Mounting conditions of this circuit card are as follows:

1. This circuit card cannot be mounted in Slot $05,07,09,10,11,12,16,18,19,21,22,23$.
2. This card is used in odd-number group $(\mathrm{G})$ of the shaded slots above.
3. To used this card, be sure to assign "RT=938" on the ASDT command.
4. Do not mount another line/trunk circuit card in a slot adjoining the DLMX card within the same Highway Block (HW) (i.e. do not mount other line/trunk card in the right side of the slot where a DLMX card is mounted).

- When this circuit card is used in a dual configuration.

Mount this circuit card in any of the shaded slots:

| Mounting Module PIM |
| :--- | :--- |

Mounting Condition
Mounting conditions of this circuit card are as follows:

1. A pair of DLMX card No. 0/No. 1 systems must be mounted in the same Highway Block (HW).
2. This circuit card cannot be mounted in 32-port slot (10, 11,12, 21, 22, 23).
3. This card is used in odd-number group $(\mathrm{G})$ of the shaded slots above.
4. To use this card, be sure to assign "RT=938" on the ASDT command.

## PA-PW54-A

Dual Power

## PA-PW54-A

## Dual Power

1. General Function

The PA-PW54-A (DPWR) circuit card supplies operating power to circuit cards located in the PIM. The -48 V input power source, which is converted to $+5 \mathrm{~V},-5 \mathrm{~V}$, and +12 V , is distributed to each circuit card in the PIM. This card also has a Ringing Generator Unit (RGU), whose output frequency and voltage can be selected from $20 \mathrm{~Hz}, 25 \mathrm{~Hz}, 75 \mathrm{Vrms}, 90 \mathrm{Vrms}$ by switch setting on this card. In addition, a Howler Tone circuit resides on this card.

Note: $\quad$ The $+80 V$ input is required for activating Message Waiting Lamps (MWLs).

## PH-IO24

Input/Output Controller

## PH-IO24

Input/Output Controller

1. General Function

The PH-IO24 (IOC) circuit card supplies the system with a serial interface, which conforms to RS-232C, between external equipment such as the Maintenance Administration Terminal (MAT), Station Message Detail Recording System (SMDR), Message Center Interface (MCI). Property Management System (PMS). The relationship between the IOC card and the associated cards is as follows, when the CPU is composed in a dual configuration.

Note: Firmware SP-3290 IO24 LV2 PROG-A is required in the Hotel system for PMS and Hotel Printer.

Figure 2-24 Location of PH-IO24 (IOC) Card within the System
2. Mounting Location/Condition

The IOC cards can be accommodated in the shaded slots $(02,03)$ as shown below.
Note: When using Business system and Hotel system, prepare the circuit card for each system.

Mounting Module LPM

3. Face Layout of Lamps, Switches and Connectors

The face layout of lamps, switches and connectors on this circuit card is shown in Figure 2-25.

Figure 2-25 Face Layout of PH-IO24 (IOC) Card

## PH-IO24

Input/Output Controller
4. Lamp Indications

The table below shows lamp indications on this circuit card.

| LAMP NAME | COLOR | DESCRIPTION |
| :---: | :---: | :--- |
| OPE/MB | Green | This circuit card is operating normally. |
|  | Red | This circuit card is placed in the make busy state. |
| IOC ALM | Red | Clock down WDT alarm occurs to the microprocessor. |
| PORT0 - PORT3 |  | RS-232C signal status indication. n = port number (0-3) |

## Page 68

Revision 4.0
6. External Interface

As illustrated below, the "68PH S 2PORTS CA-A" cable is required to connect external equipment such as the MAT, SMDR, MCI and PRT.

Securely insert the connector of the 68PH S 2PORTS CA-A into the appropriate MISC connector. Refer to the table listed below.

Note 1: The relationship between the MISC connectors and the mounting slot of the IOC (PH-IO24) circuit card is shown below.

| Mounting Slot | IOC Circuit Number | MISC Connector |
| :---: | :---: | :---: |
| 02 | $\# 0, \# 1$ | MISC 3B |
|  | $\# 2, \# 3$ | MISC 3A |
| 03 | $\# 0, \# 1$ | MISC 4B |
|  | $\# 2, \# 3$ | MISC 4A |

Note 2: The type of cables varies depending on a connected terminal and/or whether modems are used or not. More detailed information on the connecting cables is explained in the "Installation Procedure Manual".

## PH-M22

MMC

1. General Function

The main functions of the PH-M22 circuit card are:

- To collect the key setting information on the TOPU of the ISW and send the information to the ISW/ the other LNs, depending on the ISEL key setting on the ISW.
- To collect various alarm information from all the IMGs/ISW and activate MJ/MN LED on the TOPU display.

This circuit card is used for the IMX-U system.

## PH-M16/PH-M23

Line Test

## PH-M16/PH-M23 <br> \section*{Line Test}

1. General Function

This circuit card controlled by CPU is used for line test of a subscriber's line. The circuit card supports to send Howler Tone to external test equipment, besides the circuit card can detect or send various tones, and send PB (DTMF) signal for automatic trunk test.

Note: A system cannot send Howler Tone during line test. The number of available lines within the line test/automatic trunk test at the same time is only one.

Figure 2-30 Location of PH-M16/PH-M23 (LTST) Card Within the System
2. Mounting Location/Condition

The LTST circuit card can be accommodated in the shaded slots $(00,01,02)$ as shown below:
Note: IMX: Slot 00, Slot 01, Slot 02.
IMX-U: Slot 01, Slot 02 (Considering PH-M22 MMC)

## PH-PC36

## Multiplexer

1. General Function

The PH-PC36 (MUX) circuit card is an interface card for mounting line circuits and/or trunks. In between the CPR and the Port Microprocessor (PM) of the line/trunk circuit, this circuit card provides an interface for PM control and management by the CPU. Likewise in between the TSW and the line circuit/trunks, this circuit card provides an interface for multiplexing/de-multiplexing of voice Pulse Code Modulation (PCM) information and digital data information.

Figure 2-33 Location of PH-PC36 (MUX) Card in the 1 IMG System

Figure 2-34 Location of PH-PC36 (MUX) Card in the 4 IMG System

Figure 2-35 Location of PH-PC36 (MUX) Card in the IMX-U System

The PCM highway running is illustrated in the figure below. There are sixteen 2Mbps PCM highways (HW0 - HW15) in the PIM. Each PCM highway runs from a card slot to the MUX circuit card. For instance, highway number zero (HW0) appears in Slot 04 and also Slot 05, thus the HW0 carries the PCM of the Group 0, 1, 2 and 3 .

Likewise, the HW6, 7, 14, 15 cover the Groups 24 through 31. However, the time slots of Groups 24 and 25 are exclusively used for the Speech Path Memory (SPM).

All highways in the PIM lead to a MUX card, so 512 time slots ( 32 time slots per highway $\times 16$ highways $=512$ time slots) of PCM are multiplexed/de-multiplexed at a MUX and sent/received to/from the TSW circuit card across the 32.786 Mbps of the Low Voltage Differential Signaling (LVDS).

Also the MUX card provides the PM bus interface. The CPR controls and administrates the PM of the line/ trunk circuit card via the TSW and the MUX.

In addition, this circuit card supports 3-Party Conference (CFT) function and is equipped with eight circuits of 3-Party Conference. The CFT appear in time Slots 8 through 31 of the HW13 (Group 21-23).

Figure 2-36 PCM Highway Running
2. Mounting Location/Condition

For the 1 IMG system, the PH-PC36 (MUX) card is mounted in the PIM 1, 2, and 3.
For the 4 IMG system, the PH-PC36 (MUX) card is required in all PIMs.

3. Face Layout of Lamps, Switches, and Connectors

The face layout of lamps, switches, and connectors is shown in Figure 2-37.

Figure 2-37 Face Layout of PH-PC36 (MUX)
4. Lamp Indications

The contents of lamp indications of this circuit card are shown in the table below.

| LAMP NAME | COLOR | STATE |
| :---: | :---: | :--- |
| MUX ACT | Green | Remains lit while this circuit card is in ACT state. |
| SYNC | Green | Lights when 32 Mbps Frame Head (FH) synchronization is established between the <br> MUX and TSW. |
| RCLK ALM | Red | Lights when the 32 Mbps clock signals (which is supplied by TSW) loss has occurred. |
| PMCLK ALM | Red | Lights when either the following clock signals output failure has occurred. <br> - 2 Mbps clock signals (which supplies to the line/trunks) <br> - Frame Head signal <br> - 4 Mbps clock signals |
| CFT OPE | Green | Lights when the CFT circuit is valid. |

5. Switch Settings

Standard settings of switches on this circuit card are shown in the table below.

| SWITCH <br> NAME | SWITCH <br> NO | SETTING | STANDARD <br> SETTING | MEANING |
| :---: | :---: | :---: | :---: | :--- |
| MB |  | UP |  | Circuit card Make-busy. |
|  |  | DOWN | $\times$ | Circuit card Make-busy cancel. |

## PH-PC20

## Data Link Controller

1. General Function

This circuit card simultaneously provides all the Attendant Consoles (ATTs) in the system (except the 1IMG system) with information such as the termination/answer/release (abandoned) information of ATT calls, or the station idle/busy information through the TSW system link.

Figure 2-40 Location of PC-PH20 in the System
Note: $\quad M G=01 / 03 / 05 / 07$, Unit $=2$, Group $=25$, Level $=6-7$ are used to input the information into $T S W$ by the DLKC.

## PH-PC40

## Emergency Alarm Controller

1. General Function

The PH-PC40 (EMA) circuit card detects various kinds of alarms which might occur in the system, and sends out information about the detected alarm to the circuits concerned. This circuit card can activate the system MJ/MN LEDs on the TOPU. Additionally, this card can control the active/stand-by status of the CPU in the case of dual configuration. For the 1 IMG system, this circuit card has the Music-On-Hold sending function.

Figure 2-42 Location of PH-PC40 (EMA) Card in the System

## PH-PC40

## Emergency Alarm Controller

2. Mounting Location/Condition

The PH-PC40 (EMA) card is mounted in Slot 04 of the LPM, as shown below.

## Mounting Module LPM

3. Face Layout of Lamps, Switches, and Connectors

The face layout of lamps, switches, and connectors is shown in Figure 2-43.

## PH-PW14

Power Switch

## PH-PW14

## Power Switch

1. General Function

This circuit card is a power supply card that supplies DC - 48 V operating power to the circuit cards mounted in the TSWM. It also provides the DC-DC converter function which generates output power DC $+5 \mathrm{~V},-5$ V , and +12 V to MISC slots.

The two PWR SWs cards make the power supply redundant.

Figure 2-45 -48 V Output Circuit Diagram
2. Mounting Location/Conditions

This circuit card is mounted in the following shaded slots $(00,01)$.

## Mounting Module TSWM/ISWM

3. Face Layout of Lamps, Switches, and Connectors

The face layout of lamps, switches, and connectors for this circuit card is shown in Figure 2-46.

## PH-SW10

## Time Division Switch

1. General Function

This circuit card combines the Time Division Switch (TSW) with INT, PLO, MUX, and CFT.
The TSW capacity is $2048 \times 2048$ time slots, and it allows non-block switching for the maximum IMX configuration. The INT is an intermediate circuit of the CPR which controls and administrates the Port Microprocessor (PM) of line/trunk circuit cards via the PM BUS.

## [Connection diagram of the TSW]

[Function block diagram]

Figure 2-47 Location of PH-SW10 (TSW) Card in the System

Figure 2-48 shows the clock signal routing around the Phase Locked Oscillator (PLO).

Figure 2-48 PLO Function Diagram
When the system operates as the clock source office of the digital network, the OSC (PA-CK14) card is required, and the OSC supplies the high-precision clock signals ( $\pm 0.3 \mathrm{ppm}$ deviation) for the base clock of the PLO. When the system operates as the clock subordinate office, the TSW internal oscillator ( $\pm 5 \mathrm{ppm}$ deviation) can be the base clock of the PLO. The source clock of the subordinate office is either the digital clock supply (DCS) or the digital interface clock (DIU0 - DIU3). When the clock source failure has occurred, the PLO chooses another clock source automatically in the order of:

1 DCS0
2. DCS1
3. DIU0
4. DIU1
5. DIU2
6. DIU3
7. Drifting with the TSW internal oscillator

The PLO can output the clock signals (CLK) and the frame head signals (FH) as follows:

- 32.768MHz CLK
- 8 KHz FH
- $5 \mathrm{msec} \times$ " n " FH (for wireless module).

The MUX performs multiplexing/de-multiplexing of the 2 Mbps PCM highways running in PIM 0 , and it sends/receives the PCM to/from the TSW, and operates like the MUX card of PIM 1/2/3.

This circuit card includes the Digital Tone Generator (DTG) and hold tone (MUSIC) insertion circuit. The TONE ROM located on this circuit card contains the audible tone, and the hold tone is supplied from the EMA card. In addition, the designated time slot of PCM (Speech Path Memory: SPM) can be inserted as a tone/music voice prompt. (For example, you can join the SPM and a DAT port by the nailed down connection, and the DAT's voice prompt is given to the system instead of ordinary tone/music.)

Additionally, this circuit card supports the CFT (3-Party Conference) function and is equipped with eight (8) circuits of 3-Party Conference Trunk.

Figure 2-49 Voice Prompting
2. Mounting Location/Condition

This circuit card is mounted in PIM0 in the slot shown below.

3. Face Layout of Lamps, Switches, and Connectors

The face layout of lamps, switches and connectors is shown below.

Figure 2-50 Face Layout of PH-SW10 (TSW)
4. Lamp Indications

Lamp indications for this circuit card are shown in the table below.

| LAMP NAME | COLOR | STATE |
| :---: | :---: | :---: |
| TSWACT | Green | Remains lit while the TSW block is in ACT state. |
|  | Red | Remains lit while the TSW block is in Make-busy state. |
|  | Off | Remains off while the TSW block is ST-BY side. |
| MUXACT | Green | Remains lit while MUX block is in ACT state. |
| PLOACT | Green | Remains lit while PLO block is in ACT state. |
| M3SY | Green | Lights when MUX \#3 synchronization has been established. |
| M2SY | Green | Lights when MUX \#2 synchronization has been established. |
| M1SY | Green | Lights when MUX \#1 synchronization has been established. |
| M0SY | Green | Lights when MUX \#0 synchronization has been established. |
| PMCA | Red | Lights when the PM/PCM bus clock FH failure has occurred. |
| CFT | Green | Lights when the CFT circuit is valid. |
| PMJ | Red | Lights when the following MJ fault has occurred: <br> - All of the clock supply routes have failed when the system operates as the clock subordinate office <br> - $\quad 32.768 \mathrm{MHz}$ output clock failure <br> - 8 KHz output FH failure <br> - $5 \mathrm{msec} \times$ " n " output FH failure <br> - Input Frame Pulse (FP) failure (FP is supplied by the SYNC card) <br> - Both internal OSC ( $\pm 5 \mathrm{ppm}$ deviation) and high-precision clock signals ( $\pm 0.3 \mathrm{ppm}$ deviation) have failed when the system operates as the clock source office |
| PMN | Yellow | Lights when the following MN fault has occurred: <br> - One or more (but not all) DTI/DCS clock supply routes have failed <br> - Drifting failure <br> - Internal OSC ( $\pm 5 \mathrm{ppm}$ ) failure <br> - High-precision clock signals ( $\pm 0.3 \mathrm{ppm}$ ) failure |

| LAMP NAME | COLOR | STATE |
| :---: | :---: | :---: |
|  | Green | Remains lit while the system is synchronized with the network. |
| SYNC | OFF | Remains off when any of the following have occurred. <br> - DCS clock failure when receiving the clock signals from the DCS. <br> - DTI clock failure when receiving the clock signals from the DTI. <br> - Drifting failure |
| ICK | Green | Lights when the TSW (PA-SW10) internal oscillator is operating normally. <br> Note: The ICK LED will illuminate even when the internal PLO circuit is operational. |
| ECK | Green | Lights when the high-precision clock signals are received from OSC circuit card (PACK14). <br> Note: The ICK LED will not illuminate when thePA-CK14 is operational. |

5. Switch Settings

Standard settings for switches on this circuit card are shown in the table below.

| SWITCH <br> NAME | SETTING | STANDARD <br> SETTING | MEANING |
| :---: | :---: | :---: | :--- |
| MB | UP |  | Circuit card Make-busy. |
|  | DOWN | $\times$ | Circuit card Make-busy cancel. |
| TSWMBR | UP |  | TSW Make-busy request. |
|  | DOWN | $\times$ | TSW Make-busy request cancel. |
| PLOMBR | UP |  | PLO Make-busy request. |
|  | DOWN | $\times$ | PLO Make-busy request cancel. |
| SW12 | $1-F$ | 1 | Fixed to "1." |

| SWITCH NAME | SWITCH NO | SETTING | STANDARD SETTING | MEANING |
| :---: | :---: | :---: | :---: | :---: |
| SW03 | 1 | ON |  | 3-Party Conference Trunk (CFT) is valid. |

|  | 2 | ON |  | Setting of A-law in the CFT function block. |
|  |  | OFF | $\times$ | Setting of $\mu$-law in the CFT function block. |
|  | 3 | OFF | $\times$ | Fixed. |
|  | 4 | ON |  | Only MUX function is valid (If this card is mounted in PIM 1/2/3). Note |
|  |  | OFF | $\times$ | TSW/INT/PLO/MUX are valid (When this card is mounted in PIM 0). |
| SW04 | 1 | ON |  | DIU 0 is used as the DTI clock supply route zero. |
|  |  | OFF |  | DIU 0 is not used. |
|  | 2 | ON |  | DIU 1 is used as the DTI clock supply route one. |
|  |  | OFF |  | DIU 1 is not used. |
|  | 3 | ON |  | DIU 2 is used as the DTI clock supply route two. |
|  |  | OFF |  | DIU 2 is not used. |
|  | 4 | ON |  | DIU 3 is used as the DTI clock supply route three. |
|  |  | OFF |  | DIU 3 is not used. |
|  | 5 | ON | $\times$ | 1.5 M clock for DIU 0 |
|  |  | OFF |  | 2 M clock for DIU 0 |
|  | 6 | ON | $\times$ | 1.5 M clock for DIU 1 |
|  |  | OFF |  | 2 M clock for DIU 1 |
|  | 7 | ON | $\times$ | 1.5 M clock for DIU 2 |
|  |  | OFF |  | 2 M clock for DIU 2 |
|  | 8 | ON | $\times$ | 1.5 M clock for DIU 3 |
|  |  | OFF |  | 2 M clock for DIU 3 |

Note: When MUX card mode (SW03-4 ON), only MUX and CFT functions are valid. MUX 1 is used for a connection to TSW (Don't use MUX 2, 3). The LED of MUXACT, MOSY, CFT, and PMCA are valid, other LED is not lit. In the case of this mode, only SW03 is valid.

| SWITCH NAME | $\begin{aligned} & \text { SWITCH } \\ & \text { NO. } \end{aligned}$ | SETTING | STANDARD SETTING | MEANING |
| :---: | :---: | :---: | :---: | :---: |
| SW11 | 1 | ON |  | PLO operates as the clock subordinate office. |
|  |  | OFF |  | PLO operates as the clock source office. |
|  | 2 | ON |  | Digital Clock Supply route zero (DCS 0 ) is used. |
|  |  | OFF |  | Digital Clock Supply route zero (DCS 0 ) is not used. |
|  | 3 | ON |  | Digital Clock Supply route one (DCS 1) is used. |
|  |  | OFF |  | Digital Clock Supply route one (DCS 1) is not used. |
|  | 4 | ON |  | 8 KHz of Frame Head signals are not extracted from the DCS signals (which is composed of $64 \mathrm{KHz}+8 \mathrm{KHz}$ ). |
|  |  | OFF |  | 8 KHz of Frame Head signals are extracted from the DCS signals (which is composed of $64 \mathrm{KHz}+8 \mathrm{KHz}$ ). |
|  | 5 | ON |  | When clock source failure has occurred in all supply routes, the PLO outputs the original clock of the internal oscillator. |
|  |  | OFF |  | When clock source failure has occurred in all supply routes, the PLO continues outputting the current phase clock. |
|  | 6 | ON |  | This card is associated with SYNC (PA-CK16 WCS) card. |
|  |  | OFF |  | This card is not associated with SYNC (PA-CK16 WCS) card. |
|  | 7 | ON |  | (The last byte data of the DTG ROM is "FE") |
|  |  | OFF | $\times$ | (The last byte data of the DTG ROM is "FF") |
|  | 8 | OFF | $\times$ | Not used |

6. External Interface

When this circuit card is used in "clock subordinate office", clock signals from DTI, CCT, PRT must be extracted. See Figure 2-52 for more information. When this circuit card is used in "clock source office" cable connections are not necessary.

## PH-SW12

## Time Division Switch

1. General Function

This circuit card provides the Time Division Switch (TSW) and INT function for the system. Each TSW card is capable of $8192 \times 2048$ Time Slot (TS) switching for an Interface Module Group (IMG). Four cards allow $8192 \times 8192$ TS switching for the 4 IMG configuration.

The INT is an intermediate circuit of the CPR which controls and administrates the Port Microprocessor (PM) for line/trunk circuit cards.
[TSW configuration]

[INT configuration]

Figure 2-54 TSW Configuration

The TONE ROM located on this circuit card contains the audible tones, such as Dial Tone, Busy Tone, Ring Back Tone, etc. The music on hold source, either the MUSIC ROM or the external source via FM lead, is located on the PLO card. The tone and the music are inserted into their time slot at this circuit card. Additionally, this circuit card provides the Voice Prompt function that inserts the designated time slot of PCM (Speech Path Memory : SPM) into the tone or music time slot.

Figure 2-55 Music/Tone Insertion
[SPM for music channel 16-29]

$$

## PU-SW00

## Time Division Switch

1. General Function

The PU-SW00 circuit card provides the Time division Switch (TSW) and INT function for the IMX-U system. Each circuit card provides switching for a Local Node (LN) and four PU-SW00 cards and two PUSW01 (HSW) cards achieve a maximum of 32,768 time slot (TS) switching for four (4) LNs. This circuit card is located in ISWM of the ISW.

Figure 2-58 Location of PU-SW00 (TSW) (1/2)

Figure 2-59 Location of PU-SW00 (TSW) (2/2)
2. Mounting Location/Condition

This circuit card can be mounted in the shaded slots shown below.

3. Face Layout of lamps, Switches, and Connectors

The face layout of lamps, switches, and connectors is shown in Figure 2-60.

Figure 2-60 Face Layout of PU-SW00 (TSW)
4. Lamp Indications

Lamp indications for this circuit card are shown in the table below.

| LAMP NAME | COLOR | STATE |
| :---: | :---: | :--- |
| TSWACT | Green | Lights when the TDSW block is active. |
|  | Red | Lights when the TDSW block is in Make-busy state. |
| PWPALM | Red | Lights when the On-Board Power Supply (+5V) for this circuit card is abnormal. |
| HCKALM | Red | Lights when clock failure (clock down or FH output failure) occurs on the HSW card. |
| LN33 | Green | Lights when this circuit card is synchronized with the corresponding TSW/MUX of LN. |
| LN32 | Green | Lights when this circuit card is synchronized with the corresponding TSW/MUX of LN. |
| LN31 | Green | Lights when this circuit card is synchronized with the corresponding TSW/MUX of LN. |
| LN30 | Green | Lights when this circuit card is synchronized with the corresponding TSW/MUX of LN. |

## PU-SW01

## Highway Switch

1. General Function

The PU-SW01 circuit card, which is used for the IMX-U system, supports the following functions.
(a) The switch composition is T-T-S-T (T: Time division, S: Space division, T: Time division), and the space division is composed with this circuit card.
(b) This circuit card collects the 16 highways of PCM data from and sends 8 highways to TSW by one card. It is used to perform 16 highways switching by 2 PU-SW01 cards.

Figure 2-61 Location of PU-SW01 (HSW) (1/2)

## PU-SW01

Highway Switch

Figure 2-61 Location of PU-SW01 (HSW) (2/2)
2. Mounting Location/Condition

This circuit card is mounted in ISWM located in the ISW. The mounted slots are the shaded parts shown below.

3. Face Layout of lamps, Switches, and Connectors

The face layout of lamps, switches, and connectors are shown in Figure 2-62.

Figure 2-62 Face Layout of PU-SW01 (HSW)
4. Lamp Indications

Lamp indications for this circuit card are shown in the table below.

| LAMP NAME | COLOR | STATE |
| :---: | :---: | :---: |
| HSWACT | Green | Lights when the HSW block is active. |
|  | Red | Lights when the HSW block is in Make-busy state. |
| PWPALM | Red | Lights when the On-Board Power Supply (-48 V) for this circuit card is abnormal. |
| CKALF | Green | Lights when the clock/Frame Head signals are sent from \#15 circuit of TSW in ISW. |
|  | Off | Goes off when the clock/Frame Head signals are not sent from \#15 circuit of TSW in ISW. |
| CKALE | Green | Lights when the clock/Frame Head signals are sent from \#14 circuit of TSW in ISW. |
|  | Off | Goes off when the clock/Frame Head signals are not sent from \#14 circuit of TSW in ISW. |

## PZ-GT13

## Industrial Standard Architecture Gateway

1. General Function

The PZ-GT13 (ISAGT) circuit card controls the TSDW, DLKC, PLO etc. using the PH-GT09 (GT) in the TSWM. This card also provides the MISC I/O bus interface, which permits a microprocessor on the CPR to control EMA and IOC/MISC. The Industrial Standard Architecture (ISA) bus is used to connect this circuit card onto the CPR.

Figure 2-63 Location of PZ-GT13 (ISAGT)

Figure 2-64 Location of PZ-GT13 (ISAGT) in the IMX-U System (ISW)
2. Mounting Location/Condition

The PZ-GT13 is located on the ISA bus, which is allocated in the CPR as shown below.

## PZ-GT13

Industrial Standard Architecture Gateway
3. Face Layout of Connectors

The face layout of connectors is shown Figure 2-65. Neither lamps nor switches are located on this circuit card.

Figure 2-65 Face Layout of PZ-GT13 (ISAGT)
4. External Interface

This card has no lamps.
5. Switch Settings

No switch settings are required.
6. External Interface

See the NEAX2400 IMX Installation Manual.
7. Switch Setting Sheet

No switch settings are required.

## PZ-GT16 Industrial Standard Architecture Gateway

1. General Function

The PZ-GT16 (ISAGT) circuit card provides both the I/O Local bus and the MISC bus interface, which permits a microprocessor on the CPR to control the lower echelons of circuit cards. The Industrial Standard Architecture (ISA) bus is used to connect this circuit card onto the CPR.

Figure 2-66 Location of PZ-GT16 (ISAGT)

## PZ-GT16

Industrial Standard Architecture Gateway
2. Mounting Location/Condition

The PZ-GT16 (ISAGT) is located on the ISA bus, which is allocated in the CPR as shown below.

Mounting Module LPM

3. Face Layout of Connectors

The face layout of connectors is shown in Figure 2-67. There are no lamps or switches on this circuit card.

Figure 2-67 Face Layout of PZ-GT16 (ISAGT)
4. Lamp Indications

This card contains no lamps.
5. Switch Settings

No switch settings are required.
6. External Interface

See the NEAX2400 IMX Installation Manual.
7. Switch Setting Sheet

No switch settings are required.

## PZ-GT20

## Industry Standard Architecture Gateway

1. General Function

The main function of the PZ-GT20 circuit card is to connect the Industry Standard Architecture (ISA) bus located on the CPU and the Local I/O bus, permitting the microprocessor on the CPU to control the TSW, MUX cards of IMG2, 3 via the PH-GT09 card in the TSWM1. This circuit card is used for the IMX-U system.

Figure 2-68 Location of PZ-GT20 (ISAGT)
2. Mounting Location/Condition

The PZ-GT20 resides on the ISA bus that is located in the CPR as shown below.

3. Face Layout of Connectors

The face layout of connectors are shown in Figure 2-69. Neither lamps nor switches are located on this circuit card.

No switch settings are required.
6. External Interface

See the NEAX2400 IMX Installation Manual.
7. Switch Setting Sheet

No switch settings are required.

## PZ-PC19

## Local Area Network Interface

1. General Function

The PZ-PC19 (LANI) circuit card provides the interface for the 10-BASE-T and the Peripheral Component Interconnect (PCI) Bus. The microprocessor on the CPR sends/receives the Fusion Link Data and/or Maintenance Administration Terminal (MAT) data across the LAN interface (LANI).

Figure 2-70 Location of PZ-PC19 (LANI)

## CHAPTER 3 LINE/TRUNK CIRCUIT CARD REFERENCE

## 1. General

This chapter explains the following items about circuit cards.

- General Function

Explains the general function and purpose for each control circuit card.

- Mounting Location/Condition

Explains the mounting location (mounting module name and slot number, etc.) of each circuit card. If there are any conditions pertaining to mounting the circuit cards, they are also explained.

- Face Layout of Lamps, Switches, and Connectors

The locations of the lamps, switches, and connectors provided on each circuit card are illustrated by a face layout.

- Lamp Indications

Names, colors, and indication states of lamps mounted on each circuit card are listed.

- Switch Settings

Each circuit card's switches are listed with their names, switch numbers, setting and its meaning, standard setting, etc.

- External Interface

If the lead outputs of the circuit card are provided by an LT connector, the relation between the mounting slots and the LT connectors is illustrated by an LT Connector Lead Face Layout. If the lead outputs are provided by other than an LT connector, or are provided by the circuit card front connector, the connector lead locations and the connecting routes are shown.

In addition, a Switch Setting Sheet is provided at the end of the explanation of circuit cards.

## PA-CFTB

8-party Conference Trunk

## PA-CFTB

## 8-party Conference Trunk

1. General Function

The PA-CFTB (CFT) circuit card provides an interface for establishing a conference, which is made up of a maximum of eight parties.
A maximum of seven Tie Lines can participate in a conference when the associated trunks can receive an answer signal and a release signal from the distant switching system. On the other hand, in the case of a C.O. line, one C.O. line can be connected even if the public switching system cannot send an answer signal and/or release signal. Note that a Tie Line and a C.O. Line cannot take part in a conference at the same time. The card adopts "N-1 addition" method for establishing a conference.

Note: This circuit card is used for following features:

- Station-Controlled Conference (Refer to Feature Programming Manual) [S-56]
- Attendant-Controlled Conference (Refer to Feature Programming Manual) [A-2]
- Add On Conference-8 Party (Refer to Feature Programming Manual) [A-121]
- Group Call-Automatic Conference (20-party) (Refer to Wireless System Manual)

This diagram shows an example of a "Preset" conference involving Tie Line connections.

Figure 3-1 Location of PA-CFTB (CFT) within the System
2. Mounting Location/Condition

The PA-CFTB (CFT) card can be mounted in any universal slots as shown below.

## Mounting Module PIM

Note: Indicates universal slots for lineltrunk circuit cards.

## PA-CK14 <br> Oscillator

1. General Function

The PLO block of the TSW card generates its base clock signals, and adjusts their phase with the source clock signals so the PLO can send the synchronized clock signals to the TSW. When the 1 IMG system is a clock-subordinate-office of the digital network, the base clock accuracy of the PLO/ PH-SW10 ( $\pm 5 \mathrm{ppm}$ deviation) is sufficient. However, the more high-precision base clock signals are required at the clock-source-office, as this circuit card provides --- PA-CK14 ( $\pm 0.3 \mathrm{ppm}$ deviation). When this circuit card is mounted, the 1 IMG system selects the PA-CK14 (OSC) clocks as the base clock of the PLO.

Figure 3-3 Location of PA-CK14 (OSC) Card in the System
2. Mounting Location/Condition

The PA-CK14 (OSC) is located in PIM0. The card mounted in Slot 09 works as the primary OSC, 17 for the secondary OSC.

## Mounting Module PIM

| 00 | 01 | 02 | 03 | 04 | 05 | 06 | 07 | 08 | 09 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |

Note: This card occupies two slots.
3. Face Layout of Lamps, Switches, and Connectors

The face layout of lamps, switches, and connectors is shown below.

Figure 3-4 Face Layout of PA-CK14 (OSC) Card
4. Lamp Indications

Lamp indications for this circuit card are shown in the table below.

| LAMP NAME | COLOR | STATE |
| :---: | :---: | :--- |
| CLKOUT0 | Green | Lights when OSC card delivers the clock signals to TSW\#0. |
| CLKOUT1 | Green | Lights when OSC card delivers the clock signals to TSW\#1. |

5. Switch Settings

Standard settings for switches on this circuit card are shown in the table below.

| SWITCH <br> NAME | SETTING | STANDARD <br> SETTING | MEANING |
| :---: | :---: | :---: | :--- |
| MB | ON |  | Make-busy of the circuit card. |
|  | OFF | $\times$ | Normal setting. |

6. External Interface

Since the base clock signals are delivered through the printed-wiring on the Back Wired Board (BWB) of PIM 0 , this circuit card does not require any external cabling.
7. Switch Setting Sheet

| SWITCH NAME | SWITCH SHAPE | REMARKS |
| :---: | :---: | :---: |
| MB | $\square$ | ON |

## PH-CK16 <br> Phase Lock Oscillator

## 1. General Function

This circuit card, used together with a direct digital interface circuit card, sets up network synchronization with the network. With this circuit card, the 4 IMG system can be a clock subordinate office of the digital network. As seen in the figure below, the PLO can be redundant regardless of the system switching network selection.

Figure 3-5 Location of PH-CK16 (PLO) Card in the System

The source clock of the clock subordinate office is either the digital clock supply (DCS) or the digital interface clock (DIU0 - DIU3). When clock source failure has occurred, the PLO chooses another clock source automatically in the order of:

1. DCS
2. DIU0
3. DIU1
4. DIU2
5. DIU3
6. PLO changeover or the PLO internal oscillator drifting

The PLO can output the clock signals (CLK) and the frame head signals ( FH ) as follows:

- 32.768 MHz CLK
- 8 KHz FH
- $5 \mathrm{msec} \times$ " n " FH

The MUSIC ROM located on this circuit card also contains the hold tone, and is supplied to the TSW circuit card. When an external music on hold is applied to the 4 IMG system, this circuit card provides the interface for the external hold tone source.

Figure 3-6 Music Source

## PH-CK16

Phase Lock Oscillator
2. Mounting Location/Condition

This circuit card is mounted in the TSWM of the slot shown below.

Mounting Module TSWM

3. Face Layout of Lamps, Switches, and Connectors

The face layout of lamps, switches, and connectors is shown below.

Figure 3-7 Face Layout of PH-CK16 (PLO)
4. Lamp Indications

Lamp indications for this circuit card are shown in the table below.

| LAMP NAME | COLOR | STATE |
| :---: | :---: | :---: |
| ACT | Green | Remains lit while this circuit card is in active state. |
|  | Off | Remains off while this circuit card is in stand-by state. |
| MJ | Red | Lights when the following MJ fault has occurred: <br> - All of the clock supply routes have failed when the system operates as the clock subordinate office <br> - $\quad 32.768 \mathrm{MHz}$ output clock failure <br> - 8 KHz output FH failure <br> - $5 \mathrm{msec} \times$ " $n$ " output FH failure <br> - Input Frame Pulse (FP) failure (FP is supplied by the SYNC card) <br> - Internal OSC ( $\pm 5 \mathrm{ppm}$ deviation) has failed when the system operates as the clock source office |
| MN | Red | Lights when the following MN fault has occurred: <br> - One or more (but not all) DTI/DCS clock supply routes have failed <br> - Drifting failure <br> - Internal OSC ( $\pm 5 \mathrm{ppm}$ deviation) failure |
|  | Green | Remains lit while the system is synchronized with the network. |
| SYNC | OFF | Remains off when either of the following has occurred: <br> - DCS clock failure when receiving the clock signals from the DCS. <br> - DTI clock failure when receiving the clock signals from the DTI. <br> - Drifting failure |
| ICK | Green | Lights when the internal oscillator is operating normally. |
| PALM | Red | Remains lit when power is abnormal. |

5. Switch Settings

Standard settings of switches on this circuit card are shown in the table below.

| SWITCH <br> NAME | SETTING | STANDARD <br> SETTING | MEANING |
| :---: | :---: | :---: | :--- |
| MB | UP |  | Circuit card Make-busy. |
|  | DOWN | $\times$ | Circuit card Make-busy cancel. |

## PH-CK16-A

Phase Lock Oscillator
4. Lamp Indications

Lamp indications for this circuit card are shown in the table below:

| LAMP NAME | COLOR | STATE |
| :---: | :---: | :---: |
| OPE | Green | Remains lit while this circuit card is in active state. |
| MJ | Red | Lights when the following MJ fault has occurred: <br> - All of the clock supply routes have failed when the system operates as the clock subordinate office <br> - $\quad 32.768 \mathrm{MHz}$ output clock failure (including CLK card) <br> - 8 KHz output clock failure (including CLK card) <br> - Input Frame Pulse (FP) failure (FP is supplied by the SYNC card) Internal OSC ( $\pm 5 \mathrm{ppm}$ deviation) has failed when the system operates as the clock source office |
| MN | Red | Lights when the following MN fault has occurred: <br> - One or more (but not all) DTI/DCS clock supply route has failed <br> - Drifting failure <br> - Internal OSC ( $\pm 5 \mathrm{ppm}$ deviation) failure |
| SYNC | Green | Remains lit while the system is synchronized with the network. |
| ICK | Green | Lights when the internal oscillator is operating normally. |
| CKPKG Note | Green | Lights when the CLK card in TSWM1 is in normal operation. |
| ALM0 <br> Note | Red | Lights when clock failure has occurred in the CLK card. |
| ALM1 Note | Red | Lights when FH failure has occurred in the CLK card. |
| PALM | Red | Remains lit when the On-Board Power Supply is abnormal. |

Note: This lamp is effective when this card is mounted in TSWMO of the IMX-U system.
5. Switch Settings

Standard settings for switches on this circuit card are shown in the table below.

| SWITCH <br> NAME | SETTING | STANDARD <br> SETTING | MEANING |
| :---: | :---: | :---: | :--- |
| MB | UP |  | Circuit card Make-busy. |
|  | DOWN | $\times$ | Circuit card Make-busy cancel. |
| SW03 | $1-\mathrm{F}$ | 1 | Fixed to "1." |

| SWITCH NAME | $\begin{gathered} \text { SWITCH } \\ \text { NO. } \end{gathered}$ | SETTING | STANDARD SETTING |  | MEANING |
| :---: | :---: | :---: | :---: | :---: | :---: |
| SW01 <br> Note | 1 | ON |  | Note 1 | Clock subordinate office. |
|  |  | OFF |  |  | Clock source office. |
|  | 2 | ON | $\times$ | Note 1 | Digital Clock Supply route zero (DCS 0) is used. |
|  |  | OFF |  |  | Digital Clock Supply route zero (DCS 0) is not used. |
|  | 3 | ON | $\times$ | Note 1 | Digital Clock Supply route one (DCS 1) is used. |
|  |  | OFF |  |  | Digital Clock Supply route one (DCS 1) is not used. |
|  | 4 | ON |  |  | 8 KHz of Frame Head signals are extracted from the DCS signals (which is composed of $64 \mathrm{KHz}+8 \mathrm{KHz}$ ). |
|  |  | OFF | $\times$ | Note 1 | 8 KHz of Frame Head signals are not extracted from the DCS signals (which is composed of $64 \mathrm{KHz}+8 \mathrm{KHz}$ ). |
|  | 5 | ON |  |  | When clock source failure has occurred in all supply routes, the PLO outputs the original clock of the internal oscillator. |
|  |  | OFF |  | $\times$ | When clock source failure has not occurred, the PLO keeps on outputting the current phase clock. |
|  | 6 | ON | $\times$ | Note 1 | Thiscircuitcardi s associated with SYNC (PA-CK11) card. |
|  |  | OFF |  |  | This circuit card is not associated with SYNC (PA-CK16 WCS) card. |
|  | 7 | ON |  |  | A-law CODEC is used for Music-on-Hold. |
|  |  | OFF |  | $\times$ | $\mu$-law CODEC is used for Music-on-Hold. |
|  | 8 | OFF |  | $\times$ | Fixed OFF (Not used). |

Note: $\quad$ When this card is used in the 4-IMG or ISWM of the IMX-U system, specify the clock source (DCS or DTI) according to the clock network configuration for the office.

Note 1: This standard setting is applicable when this card is mounted in TSWMO of the IMX-U system.

| SWITCH NAME | $\begin{gathered} \hline \text { SWITCH } \\ \text { NO. } \end{gathered}$ | SETTING | STANDARD SETTING | MEANING |
| :---: | :---: | :---: | :---: | :---: |
| SW02 <br> Note | 1 | ON |  | DIU 0 is used as the DTI clock supply route zero. |
|  |  | OFF |  | DIU 0 is not used. |
|  | 2 | ON |  | DIU 1 is used as the DTI clock supply route one. |
|  |  | OFF |  | DIU 1 is not used. |
|  | 3 | ON |  | DIU 2 is used as the DTI clock supply route two. |
|  |  | OFF |  | DIU 2 is not used. |
|  | 4 | ON |  | DIU 3 is used as the DTI clock supply route three. |
|  |  | OFF |  | DIU 3 is not used. |

Phase Lock Oscillator

## PH-CK17 <br> Phase Lock Oscillator

1. General Function

This circuit card, used together with a direct digital interface circuit card, sets up network synchronization with the network. Since this circuit card provides a high precision base clock oscillator, the 4 IMG system can be a clock source office for the digital network. As seen in Figure 3-19, the PLO can be redundant regardless of the system switching network selection.

Figure 3-19 Location of PH-CK17 (PLO) Card in the System

The source clock of the clock subordinate office is either the digital clock supply (DCS) or the digital interface clock (DIU0 - DIU3). When clock source failure has occurred, the PLO chooses another clock source automatically in the order of:

1. DCS
2. DIU0
3. DIU1
4. DIU2
5. DIU3
6. PLO changeover or the PLO internal oscillator drifting

The PLO can output the clock signals (CLK) and the frame head signals (FH) as follows:

- $\quad 32.768 \mathrm{MHz}$ CLK
- $\quad 8 \mathrm{KHz} \mathrm{FH}$
- $5 \mathrm{msec} \times$ " n " FH

## PH-CK17

Phase Lock Oscillator
The MUSIC ROM also located on this circuit card contains the hold tone, and is supplied to the TSW circuit card. When an external music on hold is applied to the 4 IMG system, this circuit card provides the interface for the external hold tone source.

Figure 3-20 Music Source
2. Mounting Location/Condition

This circuit card is mounted in the TSWM of the slot shown below.

3. Face Layout of Lamps, Switches, and Connectors

The face layout of lamps, switches, and connectors is shown in Figure 3-21.

Figure 3-21 Face Layout of PH-CK17 (PLO)
4. Lamp Indications

Lamp indications for this circuit card are shown in the table below.

| LAMP NAME | COLOR | STATE |
| :---: | :---: | :---: |
| ACT | Green | Remains lit while this circuit card is in active state. |
|  | Off | Remains off while this circuit card is in stand-by state. |
| MJ | Red | Lights when the following MJ fault has occurred: <br> - All of the clock supply routes have failed when the system operates as the clock subordinate office. <br> - $\quad 32.768 \mathrm{MHz}$ output clock failure. <br> - 8 KHz output FH failure. <br> - $5 \mathrm{msec} \times$ " n " output FH failure. <br> - Input Frame Pulse (FP) failure (FP is supplied by the SYNC card). <br> - Internal OSC ( $\pm 0.3 \mathrm{ppm}$ deviation) has failed when the system operates as the clock source office. |
| MN | Red | Lights when the following MN fault has occurred: <br> - One or more (but not all) DTI/DCS clock supply routes failed. <br> - Drifting failure. <br> - Internal OSC ( $\pm 0.3 \mathrm{ppm}$ deviation) failure. |
|  | Green | Remains lit while the system is synchronized with the network. |
| SYNC | OFF | Remains off when either of the following has occurred. <br> - DCS clock failure when receiving the clock signals from the DCS. <br> - DTI clock failure when receiving the clock signals from the DTI. <br> - Drifting failure. |
| ICK | Green | Lights when the internal oscillator is operating normally. |
| PALM | Red | Remains lit when power is abnormal. |

5. Switch Settings

Standard settings for switches on this circuit card are shown in the table below.

| SWITCH <br> NAME | SETTING | STANDARD <br> SETTING | MEANING |
| :---: | :---: | :---: | :--- |
| MB | UP |  | Circuit card Make-busy. |
|  | DOWN | $\times$ | Circuit card Make-busy cancel. |
| SW03 | $1-\mathrm{F}$ | 1 | Fixed to "1." |

| SWITCH NAME | $\begin{aligned} & \text { SWITCH } \\ & \text { NO. } \end{aligned}$ | SETTING | STANDARD SETTING | MEANING |
| :---: | :---: | :---: | :---: | :---: |
| SW01 | 1 | ON |  | Clock subordinate office. |
|  |  | OFF |  | Clock source office. |
|  | 2 | ON |  | Digital Clock Supply route zero (DCS 0) is used. |
|  |  | OFF |  | Digital Clock Supply route zero (DCS 0) is not used. |
|  | 3 | ON |  | Digital Clock Supply route one (DCS 1) is used. |
|  |  | OFF |  | Digital Clock Supply route one (DCS 1) is not used. |
|  | 4 | ON |  | 8 KHz of Frame Head signals are not extracted from the DCS signals (which is composed of $64 \mathrm{KHz}+8 \mathrm{KHz}$ ). |
|  |  | OFF |  | 8 KHz of Frame Head signals are extracted from the DCS signals (which is composed of $64 \mathrm{KHz}+8 \mathrm{KHz}$ ). |
|  | 5 | ON |  | When clock source failure has occurred in all supply routes, the PLO outputs the original clock of the internal oscillator. |
|  |  | OFF |  | When clock source failure has occurred in all supply routes, the PLO continues outputting the current phase clock. |
|  | 6 | ON |  | This circuit card is associated with SYNC (PA-CK11) card. |
|  |  | OFF |  | This circuit card is not associated with SYNC (PA-CK11) card. |
|  | 7 | ON |  | A-law CODEC is used for the hold music. |
|  |  | OFF | $\times$ | $\mu$-law CODEC is used for the hold music. |
|  | 8 | OFF | $\times$ | Not used |

| SWITCH <br> NAME | SWITCH NO. | SETTING | STANDARD SETTING | MEANING |
| :---: | :---: | :---: | :---: | :---: |
| SW02 | 1 | ON |  | DIU 0 is used as the DTI clock supply route zero. |
|  |  | OFF |  | DIU 0 is not used. |
|  | 2 | ON |  | DIU 1 is used as the DTI clock supply route one. |
|  |  | OFF |  | DIU 1 is not used. |
|  | 3 | ON |  | DIU 2 is used as the DTI clock supply route two. |
|  |  | OFF |  | DIU 2 is not used. |
|  | 4 | ON |  | DIU 3 is used as the DTI clock supply route three. |
|  |  | OFF |  | DIU 3 is not used. |
|  | 5 | ON | $\times$ | 1.5 M clock for DIU 0 |
|  |  | OFF |  | 2 M clock for DIU 0 |
|  | 6 | ON | $\times$ | 1.5 M clock for DIU 1 |
|  |  | OFF |  | 2 M clock for DIU 1 |
|  | 7 | ON | $\times$ | 1.5 M clock for DIU 2 |
|  |  | OFF |  | 2 M clock for DIU 2 |
|  | 8 | ON | $\times$ | 1.5 M clock for DIU 3 |
|  |  | OFF |  | 2 M clock for DIU 3 |
| SW05 | 1 | ON |  | External hold tone source is used via FM lead. |
|  |  | OFF | $\times$ | MUSIC ROM is used as the hold tone. |
|  | 2 | OFF |  | Not used |

## PH-CK17

Phase Lock Oscillator
6. External Interface

When this circuit card is located in the TSWM, connect 34PH EXCLK CA-A to the EXCLK0/EXCLK1 connectors on the backplane of the TSWM.

## PH-CK17-A <br> Phase Lock Oscillator

## 1. General Function

This circuit card used together with a direct digital interface circuit card, sets up network synchronization between networks. Since this circuit card provides a high precision base clock oscillator, the system containing this circuit card can be a clock source office of the digital network. As seen in the figure below, the PLO can be redundant regardless of the system switching network selection. This circuit card is used for the IMX-U system.

Figure 3-24 Location of PH-CK17-A (PLO)

## PH-CK17-A

Phase Lock Oscillator
2. Mounting Location/Condition

This circuit card can be mounted in the shaded slots shown below.

3. Face Layout of Lamps, Switches, and Connectors

The face layout of lamps, switches, and connectors are shown in Figure 3-25

Figure 3-25 Face Layout of PH-CK17-A (PLO)
4. Lamp Indications

Lamp indications for this circuit card are shown in the table below:

| LAMP NAME | COLOR | STATE |
| :---: | :---: | :---: |
| OPE | Green | Remains lit while this circuit card is in active state. |
| MJ | Red | Lights when the following MJ fault has occurred: <br> - All of the clock supply routes have failed when the system operates as the clock subordinate office <br> - $\quad 32.768 \mathrm{MHz}$ output clock failure (including CLK card) <br> - 8 KHz output clock failure (including CLK card) <br> - Input Frame Pulse (FP) failure (FP is supplied by the SYNC card) <br> - Internal OSC ( $\pm 5 \mathrm{ppm}$ deviation) have failed when the system operates as the clock source office |
| MN | Red | Lights when the following MN fault has occurred: <br> - One or more (but not all) DTI/DCS clock supply routes have failed <br> - Drifting failure <br> - Internal OSC ( $\pm 5 \mathrm{ppm}$ deviation) failure |
| SYNC | Green | Remains lit while the system is synchronized with the network. |
| ICK | Green | Lights when the internal oscillator is operating normally. |
| CKPKG <br> Note | Green | Lights when the CLK card in TSWM1 is in normal operation. |
| ALM0 <br> Note | Red | Lights when clock failure has occurred in the CLK card. |
| ALM1 <br> Note | Red | Lights when FH failure has occurred in the CLK card. |
| PALM | Red | Remains lit when the On-Board Power Supply is abnormal. |

Note: This lamp is effective when this card is mounted in TSWMO of the IMX-U system.
5. Switch Settings

Standard settings for switches on this circuit card are shown in the table below.

| SWITCH <br> NAME | SETTING | STANDARD <br> SETTING | MEANING |
| :---: | :---: | :---: | :--- |
| MB | UP |  | Circuit card Make-busy. |
|  | DOWN | $\times$ | Circuit card Make-busy cancel. |
| SW03 | $1-\mathrm{F}$ | 1 | Fixed to "1." |

| SWITCH <br> NAME | $\begin{aligned} & \text { SWITCH } \\ & \text { NO. } \end{aligned}$ | SETTING | STANDARD SETTING | MEANING |
| :---: | :---: | :---: | :---: | :---: |
| SW01 <br> Note 1 | 1 | ON | $\times$ Note 1 | Clock subordinate office. |
|  |  | OFF |  | Clock source office. |
|  | 2 | ON | $\times$ Note 1 | Digital Clock Supply route zero (DCS 0) is used. |
|  |  | OFF |  | Digital Clock Supply route zero (DCS 0) is not used. |
|  | 3 | ON | $\times$ Note 1 | Digital Clock Supply route one (DCS 1) is used. |
|  |  | OFF |  | Digital Clock Supply route one (DCS 1) is not used. |
|  | 4 | ON |  | 8 KHz of Frame Head signals are extracted from the DCS signals (which is composed of $64 \mathrm{KHz}+8 \mathrm{KHz}$ ). |
|  |  | OFF | $\times$ Note 1 | 8 KHz of Frame Head signals are not extracted from the DCS signals (which is composed of $64 \mathrm{KHz}+8 \mathrm{KHz}$ ). |
|  | 5 | ON |  | When clock source failure has occurred in all supply routes, the PLO outputs the original clock of the internal oscillator. |
|  |  | OFF | $\times$ | When clock source failure has occurred in all supply routes, the PLO continues outputting the current phase clock. |
|  | 6 | ON | $\times$ Note 1 | This circuit card is associated with SYNC (PA-CK11) card. |
|  |  | OFF |  | This circuit card is not associated with SYNC (PA-CK11) card. |
|  | 7 | ON |  | A-law CODEC is used for Music-On-Hold. |
|  |  | OFF | $\times$ | $\mu$-law CODEC is used for Music-On-Hold. |
|  | 8 | OFF | $\times$ | Fixed OFF (Not used). |

Note 1: When this card is used in the 4-IMG or ISWM of the IMX-U system, specify the clock source (DCS or DTI) according to the clock network configuration for the office.

Note 2: This standard setting is applicable when this card is mounted in TSWM0 of the IMX-U system.

| SWITCH <br> NAME | $\begin{aligned} & \text { SWITCH } \\ & \text { NO. } \end{aligned}$ | SETTING | STANDARD SETTING | MEANING |
| :---: | :---: | :---: | :---: | :---: |
| SW02 <br> Note | 1 | ON |  | DIU 0 is used as the DTI clock supply route zero. |
|  |  | OFF |  | DIU 0 is not used. |
|  | 2 | ON |  | DIU 1 is used as the DTI clock supply route one. |
|  |  | OFF |  | DIU 1 is not used. |
|  | 3 | ON |  | DIU 2 is used as the DTI clock supply route two. |
|  |  | OFF |  | DIU 2 is not used. |
|  | 4 | ON |  | DIU 3 is used as the DTI clock supply route three. |
|  |  | OFF |  | DIU 3 is not used. |
|  | 5 | ON | $\times$ | 1.5 M clock for DIU 0 . |
|  |  | OFF |  | 2 M clock for DIU 0 . |
|  | 6 | ON | $\times$ | 1.5 M clock for DIU 1. |
|  |  | OFF |  | 2 M clock for DIU 1. |
|  | 7 | ON | $\times$ | 1.5 M clock for DIU 2. |
|  |  | OFF |  | 2 M clock for DIU 2. |
|  | 8 | ON | $\times$ | 1.5 M clock for DIU 3. |
|  |  | OFF |  | 2 M clock for DIU 3. |
| SW10 | 1 | ON |  | External hold tone source is used via FM lead. |
|  |  | OFF | $\times$ | MUSIC ROM is used as the hold tone. |
|  | 2 | ON |  | CLK card is not used. |
|  |  | OFF | $\times$ | CLK card is used. |

Note: When this card is mounted in TSWM0 of the IMX-U system, DCS clock from the ISW is used. The DTI clock can also be used as an alternate clock supply route in case of DCS clock failure.

## PH-CK18

## Clock

1. General Function

This circuit card is used for the Local Node of the IMX-U system. The main function of this circuit card is to supply basic clock signals to the system. This card receives clock signals from the Phase Lock Oscillator (PLO) located in TSWM0 of IMG1, distributing the following signals to the Time Division Switch (TSW) located in TSWM1 of IMG2.

- 32.768 MHz CLK
- 8 KHz FH
- $5 \mathrm{msec} \times$ " n " FH (for Wireless System)

Figure 3-33 Location of PH-CK18 (CLK)
2. Mounting Location/Condition

Mounting locations for this circuit card are shown below.
Mounting Module TSWM1 (IMG2)

3. Face Layout of Lamps, Switches, and Connectors

The face layout of each lamp and switch on this circuit card is shown in Figure 3-34.

|  | OFF | Off when the power feeding circuit operates normally. |
| $\begin{aligned} & \text { BLA0 } \\ & \text { BLA1 } \end{aligned}$ | Red | Lights when the corresponding circuit busy (At the same time, turns off PA lamp on the Desk Console). |
|  | $\begin{aligned} & \text { Flash } \\ & (60 \text { IPM }) \end{aligned}$ | Flashes when the corresponding circuit is in Make-busy state. |
|  | OFF | Off when the corresponding circuit is in idle (At the same time, turns onPA lamp on the Desk console). |
| BLS0 <br> BLS1 | Red | Lights when the corresponding sender circuit is in use. |
|  | $\begin{aligned} & \text { Flash } \\ & (60 \text { IPM }) \end{aligned}$ | Flashes when the corresponding sender circuit is in Make-busy state or when select signals are being transmitted. |
|  | OFF | Off when the corresponding sender circuit is in idle. |

5. Switch Setting

Standard settings for switches on this circuit card are shown in the table below.

| SWITCH <br> NAME | SETTING | STANDARD <br> SETTING | MEANING |
| :---: | :---: | :---: | :--- |
| SW00 | UP |  | Circuit card is Make-busy. |
|  | DOWN | $\times$ | Circuit card is cancel for Make-busy. |

| SWITCH <br> NAME | $\begin{gathered} \text { SWITCH } \\ \text { NO } \end{gathered}$ | SETTING | STANDARD SETTING |  | MEANIN |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SW01 | 0 | ON | $\times$ | Make-busy cancel for \#0 Desk Console. |  |  |
|  |  | OFF |  | Make-busy request for \#0 Desk Console. |  |  |
|  | 1 | ON | $\times$ | Make-busy cancel for \#1 Desk Console. |  |  |
|  |  | OFF |  | Make-busy request for \#1 Desk Console. |  |  |
|  | 2 | OFF | $\times$ | Not used |  |  |
|  | 3 | OFF | $\times$ | Not used |  |  |
| SW10 <br> (TAS\#0) | 1 | SW10 and SW13 designate the current limit resistance for TAS\#0 and TAS\#1 respectively. |  |  |  |  |
|  |  | SW10-3/ <br> SW13-3 | SW10-2/ SW13-2 | SW10-1/ SW13-1 | STANDARD SETTING | RESISTANCE |
|  |  | ON | ON | ON |  | $0 \Omega$ |
|  | 2 | ON | ON | OFF |  | $220 \Omega$ |
|  |  | ON | OFF | ON |  | $398 \boldsymbol{\Omega}$ |
|  |  | ON | OFF | OFF |  | $618 \Omega$ |
| SW13 <br> (TAS\#1) |  | OFF | ON | ON |  | $800 \Omega$ |
|  | 3 | OFF | ON | OFF |  | $1020 \Omega$ |
|  |  | OFF | OFF | ON |  | 1198 ת |
|  |  | OFF | OFF | OFF | $\times$ | $1418 \boldsymbol{\Omega}$ |
|  | 4 | This switch designates the TAS signaling system in conjunction with SW 11/12 and SW14/ 15. |  |  |  |  |
| SW11/ <br> SW12 <br> (TAS\#0) | SW11/12 and SW14/15 designate theTAS\#0 andTAS\#1 signaling system (in conjunction with SW10-4 (TAS\#0)/SW13-4 (TAS\#1). |  |  |  |  |  |
|  | SW12/ SW15 | SW11 SW14 | SW10-4/ SW13-4 | STANDARD SETTING | SIGNAL WHEN SEIZED |  |
|  |  |  |  |  | TAS 0A/ TAS 1A | TAS 0B/ TAS 1B |

Figure 3-42 Connecting Route Diagram
Note: $\quad$ The power feeding wires (BN4820/BN4821/BN4830/BN4831/GND) are not required when the power is supplied to the DESK CONSOLE locally.

## PA-CS33

Attendant Interface
Figure 3-43 shows how to connect Desk Console.

Wire the cables to the Modular Block as shown below.

Note: $\quad$ GND wires should be connected to PZ-M77. (BASE-U)

Figure 3-43 Desk Console Connection
Power supply and the maximum distance between the ATI and Desk Console. The maximum distance between the ATI circuit card and Desk Console is as shown below.

| Source | $\mathbf{0 . 5} \phi$ Cable | $\mathbf{0 . 6 5} \phi$ Cable |
| :---: | :---: | :---: |
| PBX | $1,148 \mathrm{ft}.(350 \mathrm{~m})$ | $1,640 \mathrm{ft} .(500 \mathrm{~m})$ |
| Local Power Supply | $3,937 \mathrm{ft} .(1,200 \mathrm{~m})$ | $4,921 \mathrm{ft} .(1,500 \mathrm{~m})$ |

If the distance exceeds above, estimate it according to the calculations shown in Figure 3-44.

Figure 3-44 Distance between PBX and Modular Rosette of Desk Console

## PA-CS33

Attendant Interface
Calculation of the distance between the ATI circuit card and Modular Rosette
The distance $M$ in the figure above is determined according to the Direct-Current resistance of power supply cables ( -48 V and $G N D$ ). Note that the maximum resistance is $26 \Omega$ as shown in the following formula:
$m=a+b+c \leqq 26 \Omega$
m: Maximum Direct-Current resistance between the ATI circuit card and Modular Rosette
a: Direct-Current resistance of power supply cables $(-48 \mathrm{~V}$ and GND) in the range of $A$
b: Direct-Current resistance of power supply cables (-48V and GND) in the range of $B$
c: Direct-Current resistance of power supply cables (-48V and GND) in the range of $C$

## Example of Calculation

$\mathrm{a}, \mathrm{b}$, and c are calculated by the following formulae:
Note: You are not required to use cable lengths in meters in the following formulae. You may use cable lengths in feet, yards, or whatever units you prefer. However, the units of resistance you use must match the units of length you use. For example, if you use distance in feet, you must also use DC resistance per foot.

$\mathrm{b}=\frac{\stackrel{\rightharpoonup}{2} \text { Cable resistance of DC }-48 \mathrm{~V} \text { cables }}{2}+\quad \frac{\sqrt{\mathrm{v}(\Omega / \mathrm{m}) \times \mathrm{y}(\mathrm{m})}}{2}$ Cable resistance on GND cables

$\mathrm{u} \quad:$ DC resistance per meter in the range of A $(\Omega / \mathrm{m})$
v : DC resistance per meter in the range of $\mathrm{B}(\Omega / \mathrm{m})$
w : DC resistance per meter in the range of $\mathrm{C}(\Omega / \mathrm{m})$
$x$ : Cable length (m) in the range of A
y : Cable length (m) in the range of B
z : Cable length (m) in the range of C

The location of the LT connector leads for the TAS interface is as shown in Figure 3-45.

## PA-16LCBW

## Line Circuit

1. General Function

The PA-16LCBW circuit card provides an interface between a maximum of 16 analog voice terminals and the system with a range of $1200(0 \mathrm{hm})$ inclusive of terminal resistance. This card also can send "Stutter Dial Tone," which is not a continuous tone, to an associated terminal which has no Message Waiting Lamp (MWL) instead of activating the MWL if required. In addition, momentary open/reverse battery function is provided for 16 channels on this card. This is a -48 V card.

Figure 3-46 Location of PA-16LCBW (LC) within the System

## PA-16LCBW

Line Circuit
2. Mounting Location/Condition

The PA-16LCBW (LC) circuit card can be mounted in the following universal slots.

## Mounting Module <br> PIM

Note: - Indicates universal slots for line/trunk circuit cards.
3. Face Layout of Lamps, Switches, and Connectors

The face layout of lamps, switches on this circuit card is shown in Figure 3-47.

## PA-16ELCJ

Electric Line Current

## PA-16ELCJ

## Electric Line Current

1. General Function

The PA-16ELCJ (ELC) circuit card provides an interface between the $\mathrm{D}^{\text {term }}$ and the IMX. Depending on the switch settings, this card works in the following two modes.

- 16 ELC mode: A maximum of 16 sets of $\mathrm{D}^{\text {term }} \mathrm{S}$ can be connected to this card (voice communications only).
- 8 DLC mode: A maximum of 8 sets of $D^{\text {term }}$ s can be connected to this card (simultaneous voice and data communications).

Figure 3-54 Location of PA-16ELCJ (ELC) Card in the System
There are two different kinds of firmware EPROMs are located on thePA-16ELCJ (ELC) circuit card. SP3295 16ELCJ PROG-B provides the full performance interface for ${ }^{\text {term }}$ Series E, and SP-3270 16ELCJ PROG-A provides $\mathrm{D}^{\text {term }}$ Series III interface. The following table shows the $\mathrm{D}^{\text {term }}$ performance depending on each firmware EPROM.

Table 3-1 Performance

| FIRMWARE | $\mathrm{D}^{\text {term }}$ SERIES E | $\mathrm{D}^{\text {term }}$ SERIES III |
| :---: | :---: | :---: |
| SP-3295 16ELC J PROG-B | - 24 digits wide of Liquid Crystal Display (LCD). <br> - Month and year displays following the time and date. <br> - Software keys are available and the software keys are controlled by the system. Thus, key function data can be changed by office data. | - 16 digits wide of LCD . <br> - Month and year are not displayed. <br> - Software key is not available. |
| $\begin{aligned} & \text { SP-3270 } \\ & \text { 16ELC J } \\ & \text { PROG-A } \end{aligned}$ | - 16 digits wide of LCD. <br> - Month and year are not displayed. <br> - Software keys are available. However, key function is fixed (Off-hook Ringing, Mute, Microphone, Headset). | - 16 digits wide of LCD. <br> - Month and year are not displayed. <br> - Software key is not available. |

2. Mounting Location/Condition

The PA-16ELCJ (ELC) card can be mounted in any universal slot as shown below.
Mounting Module PIM

| 00 | 01 | 02 | 03 | 04 | 05 | 06 | 07 | 08 | 09 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 |

Electric Line Current
4. Lamp Indications

Lamp indications for this circuit card are shown in the table below.

| LAMP NAME | COLOR | STATE |
| :---: | :---: | :--- |
| OPE | Green | Remains lit while on-line operations are normal. |
|  | OFF | Off when on-line operations are abnormal. |
| PALM | Red | Lights red when power supply circuit(s) is abnormal. Note |
|  | OFF | Off when all the power supply circuits are normal. |
| BL0 <br> BL15 | Green | Lights when the corresponding circuit is busy. |
|  | Flash | Flashes when the corresponding circuit is in Make-busy state or station data has not been <br> assigned. |
|  | OFF | Off when the corresponding circuit is idle. |

Note: When the PALM lamp lights red, observe the following instructions.
i) Identify the location where any in-house wires have a short circuit in all lines which belong to the PA16ELCJ card whose PALM is on.
ii) Repair the short-circuited wires of the associated $D^{\text {term }}$.
iii) Disconnect the $D^{\text {term }}$ from the rosette, then leave it disconnected for at least 1 minute.
iv) Connect the $D^{\text {term }}$ again.
5. Switch Settings

Switches on the PA-16ELCJ card have the following meanings.

| SWITCH | FUNCTION |  | SWITCH SETTING | MEANING |
| :---: | :---: | :---: | :---: | :---: |
| SW00 (MB) | Circuit Card <br> Make-busy key |  |  | Circuit card Make-busy Cancel. |
|  |  |  | $\longmapsto$ | Circuit card Make-busy. |
| $\begin{gathered} \text { SW01 } \\ \hline 12345678 \\ \square \square \square \square \square \square \square \end{gathered}$ | 1 |  |  | See Table 3-2 below. |
|  | 2 1 6 1 8 | - |  | Always ON (fixed). |
|  | 7 | ELC/DLC <br> mode <br> Designation |  | 16ELC mode. |
|  |  |  |  | 8DLC mode. |

Table 3-2 Relationship between SW01-1 and SW01-7

| SW01-7 <br> SW01-1 | ON | OFF |
| :---: | :---: | :---: |
| ON | - $\quad 16$ sets of $\mathrm{D}^{\text {term }} \mathrm{s}$ per card. <br> - Voice Communication only. | - 8 sets of $\mathrm{D}^{\text {term }}$ s per card. <br> - Data Adapter is used. |
| OFF | - 16 sets of $\mathrm{D}^{\text {term }}$ s per card. <br> - Analog Port Adapter is used, but not at the same time. | - 8 sets of $\mathrm{D}^{\text {term }}$ s per card. <br> - Analog Port Adapter is used (Both $\mathrm{D}^{\text {term }}$ and Analog terminal can be used at the same time). |

|  | $L$ |  |  |  | - |  |  |  | $\downarrow$ |  | \\| |  |  |  | - |  |  |  |  |

3. Face Layout of Lamps, Switches, and Connectors

The face layout of lamps, switches, and connectors on this circuit card is shown in Figure 3-59.

Figure 3-59 Face Layout of PA-16ELCJ-B (ELC) Card
4. Lamp Indications

The contents of lamp indications on this circuit card are shown in the table below.

| LAMP NAME | COLOR | STATE |
| :---: | :---: | :---: |
| OPE | Green | Remains lit while on-line operations are normal. |
|  | OFF | Off when on-line operations are abnormal. |
| PALM | Red | Lights red when power supply circuit(s) is abnormal. Note |
|  | OFF | Off when all the power supply circuits are normal. |
| $\begin{gathered} \text { BL0 } \\ \stackrel{1}{2} \\ \text { BL15 } \end{gathered}$ | Green | Lights when the corresponding circuit is busy. |
|  | Flash | Flashes when the corresponding circuit is in make-busy state or station data has not been assigned. |
|  | OFF | Off when the corresponding circuit is idle. |

Note: When the PALM lamp lights red, observe the following instructions.
i) Identify the location where any in-house wires have a short circuit as to all lines which belong to the PA-16ELCJ-B card whose PALM is on.
ii) Repair the short-circuited wires of the associated $D^{t e r m}$.
iii) Disconnect the $D^{\text {term }}$ from the jack, then leave it disconnected for at least 1 minute.
iv) Connect the $D^{\text {term }}$ again.

## PA-24LCBV

## Line Circuit

1. General Function

The PA-24LCBV circuit card provides an interface between a maximum of 24 -analog terminals and the system with a range of $600(\mathrm{Ohm})$ inclusive of terminal resistance. This card also can send "Stutter Dial Tone," which is not a continuous tone, to an associated terminal which has no Message Waiting Lamp (MWL) instead of activating the MWL if required.

Figure 3-62 Location of PA-24LCBV(LC) Card within the System
2. Mounting Location/Condition

The PA-24LCBV(LC) circuit card can be mounted in the following shaded slots.

3. Face Layout of Lamps, Switches and Connectors

The face layout of lamps, switches on this card is shown in Figure 3-63.

## PA-FCHA

## Fusion Call Control Handler

1. General Function

This circuit card is a protocol converter to carry the fusion-link-data from/to the other node. The Fusion-Link-Data is received/transferred from/to the CPR via HUB (PA-M96) across the TCP/IP interface. Once the FCH has received the fusion-link-data from the CPR, the HDLC CONT part of the FCH converts it to the High Level Data Link Controller (HDLC) format, then drops and inserts (D/I) onto a particular channel (or channels) of the ITU-T G. 703 digital interface.

Note: This connector is used when multiple numbers of FCH cards are cascaded.

Figure 3-69 Location ofPA-FCHA (FCH) Card in the System

## Fusion Call Control Handler

2. Mounting Location/ Condition

The FCH can be mounted in a universal slot of the PIM.

3. Face Layout of Lamps, Switches, and Connectors

The face layout of lamps, switches, and connectors is shown below.

Figure 3-70 Face Layout of PA-FCHA (FCH) Card
4. Lamp Indications

Lamp indications for this circuit card are shown in the table below.

| LAMP NAME | COLOR | STATE |
| :---: | :---: | :---: |
| OPE | Green | Remains lit while this circuit card is operating. |
| LYR | Green | Remains lit while the Fusion link is established. |
|  | Flash | Flashes when the Fusion link test result is fair. (60IPM) |
|  | OFF | Remains off when either the Fusion link is not established or the Fusion link test result is not fair. |
| LB | Green | Remains lit while 10-BASE-T port is ready to use. |
|  | OFF | Remains off when 10-BASE-T port is not ready. |
| LOAD | Green | Remains lit while this circuit card is ready to broadcast data packets. (Forwarding Status) |
|  | $\begin{aligned} & \text { Flash } \\ & (60 \text { IPM) } \end{aligned}$ | Remains lit while this circuit card is ready to broadcast data packets. (Blocking Status) |
|  | $\begin{gathered} \text { Flash } \\ (120 \text { IPM }) \end{gathered}$ | Remains lit while this circuit card is stand-by to broadcast data packets. (Learning Status) |
|  | OFF | Remains off when this circuit card is stand-by to broadcast data packets. (Null Status) |
| EST3 | Green | Remains lit while sending data. |
| EST2 | Green | Remains lit when receiving pair cable polarity is normal. |
| EST1 | Green | Remains lit while receiving data. |
| EST0 | Green | Remains lit while the link is established. |
| PWALM | Red | Remains lit when power supply failure (from the BWB) has occurred. |

5. Switch setting

Standard settings for switches on this circuit card are shown in the table below.

| SWITCH <br> NAME | SWITCH <br> NO | SETTING | STANDARD <br> SETTING | DESCRIPTION |
| :---: | :---: | :---: | :---: | :--- |
| MB <br> Note |  | UP |  | Circuit card Make-busy. |
|  |  | DOWN | $\times$ | Circuit card Make-busy cancel. |

PA-FCHA
Fusion Call Control Handler

| SWITCH <br> NAME | SWITCH <br> NO | SETTING | STANDARD <br> SETTING | DESCRIPTION |
| :---: | :---: | :---: | :---: | :--- |
| MNT | 0 | OFF | $\times$ | Not used. |
|  | 1 | OFF | $\times$ | Not used. |
|  | 2 | OFF | $\times$ | Not used. |
|  | 3 <br> Note | ON | OFF | $\times$ |
|  |  | Cancel the Make-busy-request. |  |  |

Note: The following operations are required prior to extracting the card.
(1.) Turn on the MNT3 switch.
(2.) Flip the MB switch.

| SWITCH <br> NAME | SETTING | STANDARD <br> SETTING | DESCRIPTION |
| :---: | :---: | :---: | :--- |
| MODE | $0-7$ |  | Not used. |
|  | 8 | $\times$ | Standard setting. <br> (When the DTI is connected with the card front cable.) |
|  | 9 |  | Fusion link test mode. <br> (When the DTI is connected with the card front cable.) |
|  | A - F |  | Not used. |

When the D/I DTI $(1.5 \mathrm{M})$ is connected with the card front cable.

| SWITCH <br> NAME | SWITCH <br> NO | SETTING | STANDARD <br> SETTING | DESCRIPTION |
| :---: | :---: | :---: | :---: | :--- |
| SW10 | Note | ON |  | T203 timer value is variable. |
|  | OFF | $\times$ | T203 timer value is fixed at 10 seconds. |  |
|  | $2 \sim 8$ | OFF | $\times$ | Not used. |

Note: $\quad$ T203 timer designates the maximum idle time which does not transmit any data frames. As a basic rule, the shorter T203 timer value, the earlier link failure detection will be obtained.

PA-FCHA
Fusion Call Control Handler

Note 1: When " $n$ " is bigger than 1, the Time Slot Sequence Integrity (TSSI) must be guaranteed at the network.
When " $n$ " is one or more, the corresponding $D$ channels as " $n$ " must be designated by SW11-SW12.

| SWITCH NAME | $\begin{aligned} & \text { SWITCH } \\ & \text { NO } \end{aligned}$ | SETTING | STANDARD SETTING | DESCRIPTION |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SW13 | 1 | ON |  | This SW designates the $\mathrm{D} / \mathrm{I}$ channel of the Fusion-Link-Data. $($ The number of $\mathrm{D} / \mathrm{I}$ channels $=\mathrm{n})$ |  |  |
|  |  | OFF |  |  |  |  |
|  | 2 | ON |  | Set the corresponding SW(s) to "ON" for D/I, "OFF" fo denial. |  |  |

## PA-FCHA

## Fusion Call Control Handler

Note 2: Data speed 64 kbps is used for the $T 1$ or E1 interface.
Data speed 56 kbps is used for the T1 interface with bit stealing.
Data speed 48 kbps is used for the T1 interface with both bit stealing and the Zero Code Suppression (or Bit 7 Stuffing).

Note 3: When a node is set "network," the distant node over the fusion link should be set "user," and vice versa.
6. External Interface

The cable connections among the FCH, HUB, 24DTR are shown in Figure 3-71.

Figure 3-71 FCH/HUB/DTI Connection

See the following figure when multiple numbers of FCH circuit cards are connected to a 24DTR as a cascade connection. The FCH can be combined with $\mathrm{CCH} / \mathrm{DCH}$ on a cascade connection.

One DTI card can have a maximum of five (5) Handler circuits cascaded within the FCH card, the CCH card, and/or DCH card. Since the FCH card contains one Handler circuit per card, a maximum of five (5) FCH cards can be cascaded to a DTI card.

As an example, the following (a), (b) and (c) can coexist on a cascade connection.
(a) FCH card (One (1) Handler circuit card per card)
(b) CCH card (Two (2) Handler circuits per card)
(c) DCH card (Two (2) Handler circuits per card)

Also, you must consider the cascading cable length. Note

Figure 3-72 FCH Cascade Connection
Note: A maximum cable distance between DTI and the last cascaded FCH (or CCH/DCH) is 50 cm ( $1^{\prime} 7.6^{\prime \prime}$ ).

## PA-M96

## HUB

1. General Function

This circuit card provides the repeater function which is based on ANSI/IEEE 802.3. Eight (8) of the 10BASE-T ports are located on a HUB card.

As seen from the functional connection diagram below, the HUB card is located between the CPR (LANI) and the FCH card. The HUB card distributes the Fusion link data onto FCH cards.

Note: This figure shows the fusion link with full redundancy $(N+1)$ configuration.

Figure 3-73 Location ofPA-M96 (HUB) Card in the System

## PA-M96

HUB
2. Mounting Location/Condition

The PA-M96 (HUB) card can be mounted in any universal slot of PIM0 as shown below.

3. Face Layout of Lamps, Switches, and Connectors

The face layout of lamps, switches, and connectors is shown in Figure 3-74.

Figure 3-74 Face Layout ofPA-M96 (HUB) Card
4. Lamp Indications

Lamp indications for this circuit card are shown in the table below.

| LAMP NAME | COLOR | STATE |  |
| :---: | :---: | :---: | :---: |
| OPE | Green | Remains lit while this circuit card is in normal operation. |  |
| CRS0~CRS7 | Green | Lights when the circuit card detects the carrier signal form the TPn-X port. |  |
| ST0~ST7 | Green | The meanings of the ST0~ST7 lamps vary depending on the SEL switch settings as shown in the table below. |  |
|  |  | SEL SWITCH | meanings |
|  |  | 0 | Lights when the receiving pair cable polarity of the TPn-X port is reversed. $(\mathrm{n}=0 \sim 7$ ) Note 1 |
|  |  | 2 | Lights when the 10 BASE-T (RJ-45) cable is attached to the TPn-X port, and the TCP/IP link has been established. The lamp may light regardless of the receiving pair cable polarity. ( $\mathrm{n}=$ 0~7) |
|  |  | 3 | Lights when the TPn-X port is normal. <br> Remains off when collisions have occurred at the TPn-X port. ( $\mathrm{n}=0 \sim 7$ ) Note 2 |

Note 1: This lamp is used to indicate the status of the TPn-X port. Therefore, the circuit card operates normally regardless of the cable polarity.

Note 2: This circuit card can detect data packet collisions at a TPn-X port when it would be a collision of 2048bittimes ( 2.048 ms ) or when the packet collides 32 times consecutively. The port is then locked-out until the collision is over.
5. Switch Setting

Standard settings for switches on this circuit card are shown in the table below.

| SWITCH <br> NAME | SETTING | STANDARD <br> SETTING | DESCRIPTION |
| :---: | :---: | :---: | :--- |
| MB | UP |  | Circuit card Make-busy. |
|  | DOWN | $\times$ | Circuit card Make-busy cancel. |
|  | 0 |  | Polarity indication on the STn lamps for TPn-X ports ( $\mathrm{n}=0 \sim 7$ ). |
|  | 1 |  | Not used. |
|  | 2 | $\times$ | TPn-X ports operate as a repeater HUB. $(\mathrm{n}=0 \sim 7)$. |
|  | 3 |  | Data-Packet-Collision indication on the STn lamps for TPn- X ports <br> $(\mathrm{n}=0 \sim 7)$. |

## PA-8RSTY

## Register Sender Trunk

1. General Function

The PA-8RSTY circuit card is equipped with eight circuits of Registers and Senders. More specifically, this card contains Dial Pulse Register (DPR), Push Button Receiver (PBR) for receiving digits from extensions and/or the associated incoming trunks and Dial Pulse Sender (DPS), PB Signal Sender (PBS) for sending digits to a distant switching system. In addition, this card has "Register Sender" function, by which interdigit pause can be changed and PB signals may be converted to DP signals and vice versa without intervention of the CPU. The card can be used for caller ID service.

This figure shows "Register Sender" function as an example.

Figure 3-76 Location of PA-8RSTY (RST) Within the System
2. Mounting Location/Condition

The PA-8RSTY (RST) card can be mounted any universal slots as shown below.

Note: - Indicates universal slots for line/trunk circuit cards.
3. Face Layout of Lamps, Switches, and Connectors

The face layout of lamps, switches, and connectors on this circuit card is shown in Figure 3-77.
Note: Layout of Lamps and switches are differ from other RST cards.

Figure 3-77 Face Layout ofPA-8RSTY (RST)

## PA-SDTA

## SDH/SONET Digital Trunk

1. General Function

The PA-SDTA circuit card provides a maximum of 28 interface ( 1.5 Mbps ) used with the fiber optic cable. This card has also the MUX function and is connected directly to the TSW card. This card is used with the PA-SDTB card.

Fusion Link with FCCH

Fusion Link without FCCH

FCH: Fusion Call Control Handler
Figure 3-78 Location of PA-SDTA (SDT) Card in the System

## PA-SDTA

## SDH/SONET Digital Trunk

2. Mounting Location/Condition

This circuit card is mounted in a universal slot next to (either left or right side of) PA-SDTB. When this card is provided in a dual configuration, mount this card on both sides of PA-SDTB.

Mounting conditions are shown below.

- Only the power is supplied from Back Wiring Board (BWB).
- This card is connected to the PA-SDTB card using the following front cables.
- For single configuration: SDT CABLEB <S>
- For dual configuration: SDT CABLEA <D>
- Fiber optic cables are connected to this card.
- Time slots used for this circuit card are determined by the cable connection between the PA-SDTB and TSW.

Example: When the PA-SDTA card is mounted in the 1-IMG system
As shown in Figure 3-79, time slots of Module Group 01 are used. AUNT data is required even if PIM2/ PIM3 is not actually mounted.

Figure 3-79 PA-SDTA Card Mounted in the 1 IMG System

## PA-SDTA

SDH/SONET Digital Trunk
3. Face Layout of Lamps, Switches, and Connectors

The face layout for lamps, switches, and connectors are shown in Figure 3-80.

Figure 3-80 Face Layout of PA-SDTA (SDT)
4. Lamp Indications

Lamp indications for this circuit card are shown in the table below.

| LAMP NAME | COLOR | STATE |
| :---: | :---: | :--- |
| OPE | Green | Remains lit while this circuit card is operating normally. |
|  | Red | Remains lit while this circuit card is in Make-busy state. |
| PALM | Red | Lights when the OBP in this circuit card is abnormal. |
| OPT | Red | Lights when the optical input signals are cut off. |
| SYNC | Red | Lights when receiving 52 Mbps clock synchronization. |
| LPB | Green | Lights when Loop-back is designated. |
| ACT | Green | Remains lit while this circuit card is in active state. |
|  | Off | Remains off while this circuit card is in stand-by state. |

5. Switch Settings

Switch settings on this circuit card are shown in the table below.

| SWITCH <br> NAME | SWITCH NO. | SETTING | STANDARD SETTING | MEANING |
| :---: | :---: | :---: | :---: | :---: |
| MB |  | UP |  | Circuit card Make-busy |
|  |  | DOWN | $\times$ | Circuit card Make-busy cancel |
| SW11 | 1 | OFF | $\times$ | Fixed |
|  | 2 | ON | $\times$ | Fixed |
|  | 3 | ON | $\times$ | Fixed |
|  | 4 | OFF | $\times$ | Fixed |
|  | 5 | OFF | $\times$ | Not used |
|  | 6 | ON |  | PAD function is effective. |
|  |  | OFF | $\times$ | PAD function is not effective. |
|  | 7 | ON |  | Setting of A-law |
|  |  | OFF | $\times$ | Setting of $\mu$-law |
|  | 8 | ON | $\times$ | OPT\#0 Act (This card is used for System 0) |
|  |  | OFF |  | OPT\#1 Act (This card is used for System 1) |
| SW12 | 1-8 | OFF | $\times$ | Not used |
| P-SW | 1 | ON |  | Designation of OLLPB (OPT Local Loop-back) |
|  |  | OFF | $\times$ | Designation of OLLPB cancel |
|  | 2 | ON |  | Designation of ORLPB (OPT Remote Loop-back) |
|  |  | OFF | $\times$ | Designation of ORLPB cancel. |
|  | 3 | OFF | $\times$ | Not used |
|  | 4 | ON |  | Make-busy request |
|  |  | OFF | $\times$ | Make-busy request cancel |

## PA-SDTA

## SDH/SONET Digital Trunk

- When the PA-SDTA/PA-SDTB card is mounted in the 1-IMG system

As shown in the following figure, time slots of Module Group 01 are used. AUNT data is required even if PIM2/PIM3 is not actually mounted.

Figure 3-83 Example of Cable Connection for 1-IMG System

- When the PA-SDTA and PA-SDTB cards are mounted in the 4-IMG system
(a) When to use the 34PH MT24 TSW CA-x cable:

When the PA-SDTA and PA-SDTB cards are mounted in the 4-IMG system, the 34PH MT24 TSW CA-x cable is used for connection between the PA-SDTB and TSW. The type of cable varies depending on the mounting location of the PA-SDTA/PA-SDTB card(s).

Table 3-4 Type of 34PH MT24 TSW CA-x Cable

|  | IMG0 | IMG1 | IMG2 | IMG3 |
| :---: | :---: | :---: | :---: | :---: |
| PIM3 | 34PH MT24 TSW CA-H | 34PH MT24 TSW CA-G | 34PH MT24 TSW CA-H | 34PH MT24 TSW CA-J |
| PIM2 | 34PH MT24 TSW CA-H | 34PH MT24 TSW CA-F | 34PH MT24 TSW CA-H | 34PH MT24 TSW CA-I |
| PIM1 | 34PH MT24 TSW CA-F | 34PH MT24 TSW CA-E | 34PH MT24 TSW CA-G | 34PH MT24 TSW CA-H |
| PIM0 | 34PH MT24 TSW CA-F | 34PH MT24 TSW CA-D | 34PH MT24 TSW CA-F | 34PH MT24 TSW CA-H |

(b) Relationship between the cable connection and the time slot:

Trunk data for SDT is assigned to an odd-number Module Group. The module group is determined by the connection of the 34PH MT24 TSW CA-x cable as shown in the table below.

Table 3-5 Relationship between Cable Connection and Time Slot

| MODULE GROUP Assigned for SDT | TIME SLOTS Assigned for SDT | CABLE CONNECTIONS |  | REMARKS |
| :---: | :---: | :---: | :---: | :---: |
|  |  | FROM (Connectors on PA-SDTB) | TO <br> (Connectors on BWB of TSWM) |  |
| MG01 | PIM2 of IMG0 | MUX0A | MUX002 | In this case, PIM2 and PIM3 of IMG0 are not actually mounted; However, AUNT data for PIM2/PIM3 is required. |
|  |  | MUX1A | MUX102 |  |
|  | PIM3 of IMG0 | MUX0B | MUX003 |  |
|  |  | MUX1B | MUX103 |  |
| MG03 | PIM2 of IMG1 | MUX0A | MUX012 | In this case, PIM2 and PIM3 of IMG1 are not actually mounted; However, AUNT data for PIM2/PIM3 is required. |
|  |  | MUX1A | MUX112 |  |
|  | PIM3 of IMG1 | MUX0B | MUX013 |  |
|  |  | MUX1B | MUX113 |  |
| MG05 | PIM2 of IMG2 | MUX0A | MUX022 | In this case, PIM2 and PIM3 of IMG2 are not actually mounted; However, AUNT data for PIM2/PIM3 is required. |
|  |  | MUX1A | MUX122 |  |
|  | PIM3 of IMG2 | MUX0B | MUX023 |  |
|  |  | MUX1B | MUX123 |  |
| MG07 | PIM2 of IMG3 | MUX0A | MUX032 | In this case, PIM2 and PIM3 of IMG3 are not actually mounted; However, AUNT data for PIM2/PIM3 is required. |
|  |  | MUX1A | MUX132 |  |
|  | PIM3 of IMG3 | MUX0B | MUX033 |  |
|  |  | MUX1B | MUX133 |  |

Note 1: MUXIx on PA-SDTB and MUXIxx on BWB of TSWM are used when the system is a dual configuration.
Note 2: When half of the time slots are used in a module group, time slots for PIM2 must be used. However, the remaining time slots (for PIM3) cannot be used for other circuit cards.

Example: When the PA-SDTA and PA-SDTB circuit cards are mounted in PIM3 of IMG0, and MG07 (PIM2 and PIM3 of IMG3) is assigned for the SDT interface, the type of cable and connector locations are as shown in the following figure. The mounting location of PA-SDTA/PA-SDTB circuit card has no relationship to the time slots assigned for the SDT interface so the PA-SDTA and PA-SDTB circuit cards can be mounted in any PIM.

Connect the cables according to the time slots assigned for SDT.
(Refer to Table 3-5 and Figure 3-85.)
Figure 3-84 Example of Cable Connection for 4-IMG System

## Page 320

Figure 3-85 Location of MUXxxx Connectors for SDT
(c) Length of Fiber Optic Cable

The maximum length of the fiber optic cable is approximately 15 kilometers ( 9.3 miles). Figure 3-86 shows the level diagram of the fiber optic interface.

Figure 3-86 Level Diagram

Level margin in the case of 15 kilometers ( 9.3 miles) is shown in Table 3-6.

Table 3-6 Level Margin

| CONDITION | LEVEL MARGIN |
| :---: | :---: |
| Worst case | 4.0 dB |
| Best case | 11.0 dB |

Note: Maximum cable length varies depending on the type of cable and the number of connection points.

## PA-SDTB

## SDH/SONET Digital Trunk

1. General Function

The PA-SDTA circuit card provides a maximum of 28 interface ( 1.5 Mbps ) used with the fiber optic cable. This card also has the MUX function and is connected directly to the TSW card. This card is used with the PA-SDTA card.

Fusion Link with FCCH

Fusion Link without FCCH

*) SDT: SDH/SONET Digital Trunk
FCH: Fusion Call Control Handler
Figure 3-87 Location of PA-SDTB (SDT) Card in the System
2. Mounting Location/Condition

This circuit card can be mounted in any universal slots.

| Mounting Module |
| :--- |
| 00 01 02 03 04 05 06 07 08 09 10 11 12 13 14 15 16 17 18 19 20 21 22 23 |

Mounting conditions are shown below.

- Only the power is supplied from Back Wiring Board (BWB).
- This card is connected to the PA-SDTA card using the following front cables.
- For single configuration: SDT CABLEB <S>
- For dual configuration: SDT CABLEA <D>
- This card is connected to the TSW card.
- Time slots used for this circuit card are determined by the cable connection between the PA-SDTB and TSW.

## PA-SDTB

SDH/SONET Digital Trunk
3. Face Layout of Lamps, Switches, and Connectors

The face layout of lamps, switches, and connectors are shown in Figure 3-88.

Figure 3-88 Face Layout ofPA-SDTB (SDT)
4. Lamp Indications

Lamp indications for this circuit card are shown in the table below:

| LAMP NAME | COLOR |  |
| :---: | :---: | :--- |
| OPE | Green | RTATE |
|  | Red | Remains lit when this circuit card is in operation. |
| 2MALA | Red this circuit card is in non-operation. |  |
| 2MALB | Red | Lights when 2 M clock and FH from A-side MUX is abnormal. |
| 32MALA | Red | Lights when 2 M clock and FH from B-side MUX is abnormal. |
| 32MALB | Red | Lights when 32 M clock from B-side MUX is abnormal. |
| ACT0 | Green | Remains lit when MUX\#0 is operating normally. |
|  | Off | Remains off when MUX\#0 is in stand-by state. |
| ACT1 | Green | Remains lit when MUX\#1 is operating normally. |
|  | Off | Remains off when MUX\#1 is in stand-by state. |
| SYC0A | Green | Lights when MUX\#0 synchronization with TSW is established in A-side. |
|  | Off | Goes off when the synchronization is not established. |
| SYC1A | Green | Lights when MUX\#1 synchronization with TSW is established in A-side. |
|  | Off | Goes off when the synchronization is not established. |
|  | Green | Lights when MUX\#0 synchronization with TSW is established in B-side. |
|  | Off | Goes off when the synchronization is not established. |
|  | Green | Lights when MUX\#1 synchronization with TSW is established in B-side. |

Note: $\quad A$-side MUX means the card located in UNITO/l and B-side MUX means the card located in UNIT 2/3.
